# SETS OF MULTIPLICITY IN LOCALLY COMPACT ABELIAN GROUPS 

## by N . Th. VAROPOULOS

## Introduction, notations and remarks.

Let $G$ be a locally compact additive abelian group. In what follows we shall use freely standardized and well-established notations and terminology. We shall for instance always denote by $O=O_{G}$ the zero element of $G$. We shall denote by $\mathbf{Z}$ and $\mathbf{R}^{n}$ the group of the integers and the Euclidean $n$-space respectively.
$\mathrm{M}(\mathrm{G}) \triangleright \mathrm{M}_{0}(\mathrm{G})$ denotes the complex Banach algebra of all bounded complex Radon measures on $G$, and the closed ideal of those, whose Fourier transform vanishes at the infinity of $\hat{G}$, the character group of $G . M^{+}(G) \subset M(G)$ will denote the cone of positive measure and $\mathrm{M}_{0}^{+}(\mathrm{G})=\mathrm{M}^{+}(\mathrm{G}) \cap \mathrm{M}_{0}(\mathrm{G}) \cdot \mathrm{M}(\mathrm{G})$ has a natural involution $\mu \rightarrow \tilde{\mu}=\overline{\mu(-x)}$. For $\mu \in \mathrm{M}(\mathrm{G}), s(\mu)$ will denote the support of $\mu$ i.e. the smallest closed set whose complement is a $\mu$-null set. We shall denote by $h_{G}$ the Haar measure of G which is unique up to multiplicative constant; when G is compact $h_{\mathrm{G}}$ will always be normalised by $h_{\mathrm{G}}(\mathrm{G})=1$. We shall denote by $L_{1}(G)$ the algebra of elements of $M(G)$ which are absolutely continuous with respect to $h_{\mathrm{G}}$.

For $\mathrm{P}, \mathrm{Q} \subset \mathrm{G}$ subsets of G and $n \in \mathbf{Z}$ we denote: $\xi_{\mathrm{P}}$ the characteristic function of P i.e. $\xi_{\mathrm{P}}(x)=1$ if $x \in \mathrm{P}$; and $\xi_{\mathrm{P}}(x)=0$ if $x \notin \mathrm{P}$.

$$
\begin{gathered}
\mathrm{P}+\mathrm{Q}=\{x+y ; \quad x \in \mathrm{P}, \quad y \in \mathrm{Q}\} \subset \mathrm{G} \\
n \mathrm{P}=\left\{\begin{array}{c}
\left.\operatorname{sgn}(n) \sum_{j=1}^{|n|} x_{j} ; \quad x_{j} \in \mathrm{P}, \quad 1 \leqslant j \leqslant|n|\right\} \subset \mathrm{G} \\
\mathrm{G} p(\mathrm{P})=\mathrm{G} p\{x ; x \in \mathrm{P}\} .
\end{array}\right.
\end{gathered}
$$

$\tau_{n}: G \rightarrow G$ the continuous endomorphism : $\tau_{n}(g)=n g$ for $g \in \mathrm{G}$. For any set $\mathrm{X},|\mathrm{X}|$ will denote the cardinal number of X . For any $x \in \mathbf{R}, x \geqslant 0 ;[x]=\sup \{n \in \mathbf{Z} ; n \leqslant x\}$ will denote the integral part of $x$.

We shall also use the letter $C$, possibly with suffixes, to denote absolute positive constants, appearing in various formulae (not necessarily the same constant everywhere).

Finally we shall follow N. Bourbaki [1] for measure theory and Loève's book [4] for probability theory.

We now make a number of definitions:
Definition I. - A subset $\mathrm{P} \subset \mathrm{G}$ will be called strongly independent if, for all N , positive integer, any family of N distinct points of $\mathrm{P},\left(p_{j} \in \mathrm{P}\right)_{j=1}^{\mathrm{N}}$, and any family of N integers, $\left(n_{j} \in \mathbf{Z}\right)_{j=1}^{\mathrm{N}}$ such that $\sum_{j=1}^{\mathrm{N}} n_{j} p_{j}=\mathrm{O}_{\mathrm{G}}$, we must have $\tau_{n_{j}}(\mathrm{P})=\mathrm{O}_{\mathrm{G}}$
for all $1 \leqslant j \leqslant \mathrm{~N}$.

Definition S. - A positive Radon measure on G ,

$$
\mathrm{O} \neq \mu \in \mathrm{M}^{+}(\mathrm{G})
$$

will be called an S-measure (Salem) if:

$$
\begin{equation*}
\mu \in M_{0}(G) \tag{i}
\end{equation*}
$$

(ii) $\quad s(\mu)$ is compact and $\quad h_{G}[G p(s(\mu))]=0$.

Definition $\mathrm{S}^{*}$. - A positive Radon measure on G ,

$$
0 \neq \mu \in \mathrm{M}_{0}^{+}(\mathrm{G})
$$

spill be called an $\mathrm{S}^{*}$-measure if it is an S -measure and if:
(iii) $\quad m \in \mathbf{Z}, \quad \tau_{m}(\mathrm{G}) \neq \mathrm{O}_{\mathrm{G}} \Longrightarrow \bar{h}_{\mathrm{G}}[g \in \mathrm{G} ; \quad m g \in \mathrm{G} p(s(\mu))]=0$.

Definition R. - A subset $\mathrm{P} \subset \mathrm{G}$ will be called an R-set (Rudin) of G , if it is perfect, strongly independent and if there exists $\mu \in \mathrm{M}_{0}^{+}(\mathrm{G}), \mu \neq 0$, such that $s(\mu) \subset \mathrm{P}$.

The two main theorems of this paper can be stated:
Theorem S. - Every non discrete, locally compact, abelian group has S-measures.

Theorem R. - Every non discrete, metrisable, locally compact, abelian group has R -sets.

We point out that the only point of introducing the concept of $\mathrm{S}^{*}$-measures is, that it is through them that R -sets will be constracted. In many important cases every S-measure is automatically an $\mathrm{S}^{*}$-measure. We have:

Lemma 0.1. - Let G be a denumerable at infinity, locally compact, abelian group, then we can afirm that esery S-measure on G is an $\mathrm{S}^{*}$-measure, provided that the following hypothesis (H) is satisfied for G .
(H) For esery open subgroup $\Omega \subset G$ and every $m \in \mathbf{Z}$ we have:

$$
\tau_{m}(\mathrm{G}) \neq \mathrm{O}_{\mathrm{G}} \Longrightarrow h_{\mathrm{G}}\left[\tau_{m}(\Omega)\right] \neq 0
$$

Proof. - Observe that for an S-measure $\mu$ on G and every $m \in \mathbf{Z}$, the set $[g \in \mathrm{G} ; m g \in \mathrm{Gp}(s(\mu))$ ] is a Borel subgroup of G ; thus if it has a positive $h_{G}$ measure it must be an open subgroup; and that is impossible if $\tau_{m}(G) \neq \mathrm{O}_{\mathrm{G}}$ by the hypothesis (H).

Lemma 0.2. - The following groups satisfy hypothesis (H).
( $\alpha$ ) $\mathbf{R}$ and $\mathbf{T}=\mathbf{R} / \mathbf{Z}$ the one dimensional torus.
( $\beta \mathbf{} \mathbf{U}(p)=\left(\mathbf{Z}\left(p^{\infty}\right)\right)^{\wedge}$ the additive group of $p$-adic integers for some prime $p$.
$\underset{p_{n}}{(\gamma) \mathrm{G} \rightarrow \infty} \infty=\prod_{n=1}^{\infty} \mathbf{Z}\left(p_{n}\right)$ for prime numbers $p_{n}(n \geqslant 1)$ such that
Proof. - ( $\alpha$ ) Immediate.
( $\beta$ ) By dualising a well-known property of $\mathbf{Z}\left(p^{\infty}\right)$ (cf. [3] 2 (9)) we see that every non zero closed subgroup of $\mathbf{U}(p)$ has finite index in $\mathbf{U}(p)$ and thus positive Haar measure. It suffices then to observe for any $\Omega \subset \mathbf{U}(p)$ open subgroup, and $m \neq 0$, $\tau_{m}(\Omega)$ is a non zero compact subgroup.
( $\gamma$ ) The open subgroups $\Omega_{\mathrm{N}}=\prod_{n \geqslant \mathrm{~N}} \mathbf{Z}\left(p_{n}\right)(\mathrm{N} \in \mathbf{Z}, \mathrm{N} \geqslant 1)$ form a neighbourhood basis of $\mathrm{O}_{\mathrm{G}}$. And to see property (H) it suffices to observe that, since $p_{n} \xrightarrow[n \rightarrow \infty]{ } \infty$, for all $m \in \mathbf{Z}, m \neq 0$, there exists $\mathrm{N}_{0}=\mathrm{N}_{0}(m)$ such that $\tau_{m}\left(\Omega_{\mathrm{v}}\right)=\Omega_{\mathrm{v}}$ for all $\mathrm{N} \geqslant \mathrm{N}_{0}$.

The material of this paper is divided:
§ 1 The main tools and specialized notations for our contractions are introduced.
$\S 2$ We treat the case $\mathrm{G}=\prod_{n=1}^{\infty} \mathbf{Z}\left(p_{n}\right)$ where $p_{n}(n \geqslant 1)$ are prime numbers increasing very rapidly (in a sense to be specified).
$\S 3 \mathrm{We}$ treat the case $\mathrm{G}=\mathbf{U}(p)=\left(\mathbf{Z}\left(p^{\infty}\right)\right)^{\wedge}$ the group of $p$-adic integers, for some fixed prime $p$.
$\S 4$ We treat the case $\mathrm{G}=\prod_{n=1}^{\infty} \mathrm{G}_{n}$ where $\mathrm{G}_{n} \cong \mathbf{Z}\left(p^{\mathrm{N}}\right)$, for some fixed prime $p$ and some fixed $N \in Z . N \geqslant 1$, and all $n \geqslant 1$.
$\S 5 \mathrm{We}$ treat the case $\mathrm{G}=\prod_{n=1}^{\infty} \mathbf{Z}\left(p^{n}\right)$ for some fixed prime $p$. $\S 6$ We prove Theorem S .
§ 7 We prove Theorem R.
It might be worth observing that $\S 2, \S 3, \S 4$ do not depend on each other and that $\S 5$ depends only on $\S 3$.

The names of Salem and Rudin, we use, are justified by [7] and [5].

## 1. The main tools and notations for the constructions.

We start by introducing some notations that will prove useful.

For, $r, m \in \mathbf{Z} ; r \geqslant 1, m \geqslant 1$ we set:

$$
\sigma(r ; m)=\frac{1}{m} \sum_{j=0}^{m-1}\left|\cos \frac{2 \pi j}{m}\right|
$$

and :

$$
\sigma(\boldsymbol{r})=\sigma(r ; \infty)=\int_{0}^{2 \pi}|\cos \theta|^{r} d \theta
$$

we have by the mean value theorem:

$$
\begin{equation*}
|\sigma(r, m)-\sigma(r)| \leqslant \frac{\mathrm{C}_{1} r}{m} \tag{1.1}
\end{equation*}
$$

also elementary considerations give [7] p. 537 :

$$
\begin{equation*}
\sigma(r) \leqslant \frac{\mathrm{C}_{2}}{\sqrt{r}} \tag{1.2}
\end{equation*}
$$

Let now for the rest of this paragraph denote by G a metri-
sable, compact, abelian group and let:

$$
\Sigma \quad \mathrm{G}=\mathrm{G}_{0} \supseteq \mathrm{G}_{1} \supseteq \cdots \supseteq \mathrm{G}_{n} \supseteq \cdots \supseteq \bigcap_{n=1}^{\infty} \mathrm{G}_{n}=\left\{\mathrm{O}_{\mathrm{G}}\right\}
$$

be a series of compact open subgroups.
We shall associate with $G$ and $\Sigma$ two probability spaces:

$$
(\Omega, \mathscr{B}, \mathrm{P}) \quad \text { and } \quad\left(\Omega^{\prime}, \mathscr{B}^{\prime}, \mathrm{P}^{\prime}\right)
$$

as follows:

$$
\Omega=\prod_{n=1}^{\infty} \mathrm{G}_{n} \quad \text { and } \quad \Omega^{\prime}=\prod_{n=1}^{\infty} \mathrm{L}_{n}
$$

where $\mathrm{L}_{n}=\mathrm{G}_{n} \times \mathrm{G}_{n} ; \mathscr{B}_{\text {a }}$ and $\mathscr{B}^{\prime}$ are the topological Borel fields of $\Omega$ and $\Omega^{\prime}$ respectively (for the Tychonov topology of course);

$$
\mathrm{P}=h_{\Omega}=\bigotimes_{n=1}^{\infty} h_{\mathrm{G}_{n}} \quad \text { and } \quad \mathrm{P}^{\prime}=h_{\Omega^{\prime}}=\bigotimes_{n=1}^{\infty} h_{\mathrm{L}_{\mathrm{n}}} .
$$

We shall now define on $\Omega$ and $\Omega^{\prime}$ two random Radon measures of $G$ as follows :

Definition $\Omega$. - With each

$$
\omega \in \Omega\left[\omega=\left(g_{1}, g_{2}, \ldots, g_{n}, \ldots\right) ; g_{n} \in G_{n}\right]
$$

мe associate a sequence of Radon measures on $G\left\{\mu_{j, \omega}\right\}_{j=1}^{\infty}$ defined by:
$s\left(\mu_{j, \omega}\right)=\left\{g_{j}, g_{j}^{-1}\right\} \quad$ and $\quad \mu_{j, \omega}\left(\left\{g_{j}\right\}\right)=\mu_{j, \omega}\left(\left\{g_{j}^{-1}\right\}\right)=\frac{1}{2} ;$
for $j \geqslant 1$ se then define:

$$
\mu=\mu_{\omega}={\underset{j=1}{\star}}_{\underset{j}{*}}^{\mu_{j, \omega}}=\lim _{\mathbf{N}}{\underset{j=1}{\mathbf{N}} \mu_{j, \omega} \in \mathrm{M}^{+}(\mathrm{G}) .}^{\text {. }}
$$

We shall call $\mu=\mu_{\omega}$ the $\Omega(=\Omega[\mathrm{G}, \Sigma])$-random measure associated with $\Sigma$, and $\mu_{j}=\mu_{j, \omega}$ its $j^{\text {th }}$ component.

Definition $\Omega^{\prime}$ (only needed for § 4). - With each
$\omega^{\prime} \in \Omega^{\prime}\left[\omega^{\prime}=\left(l_{1}, l_{2}, \ldots, l_{n}, \ldots\right) ; l_{n}=\left(g_{n}, g_{n}^{\prime}\right) \in \mathrm{L}_{n}=\mathrm{G}_{n} \times \mathrm{G}_{n}\right]$ we associate a sequence of Radon measures on $\mathrm{G}\left\{\mu_{j, \omega^{*}}^{\prime}\right\}_{j=1}^{\infty}$
defined by:
$s\left(\mu_{j, \omega^{\prime}}^{\prime}\right)=\left\{g_{j}, g_{j}^{\prime}\right\} \quad$ and $\quad \mu_{j, \omega^{\prime}}^{\prime}\left(\left\{g_{j}\right\}\right)=\mu_{j, \omega^{\prime}}^{\prime}\left(\left\{g_{j}^{\prime}\right\}\right)=\frac{1}{2} ;$
for $j \geqslant 1$ we then define:

We shall call $\mu^{\prime}=\mu_{\omega^{\prime}}^{\prime}$ the $\Omega^{\prime}\left(=\Omega^{\prime}[G, \Sigma]\right)$-random measure associated with $\Sigma$, and $\mu_{j}^{\prime}=\mu_{j, \omega^{\prime}}^{\prime}$ its $j^{\text {th }}$ component.

We make at once a number of important remarks :
Remarks. - (1.i.) The convergence of the infinite, convolution product appearing in both definitions $\Omega$ and $\Omega^{\prime}$ is taken for the vague topology of measures, and is assured by the fact that $\bigcap_{n=1}^{\infty} \mathrm{G}_{n}=\left\{\mathrm{O}_{\mathrm{G}}\right\}$ and $s\left(\mu_{j, \omega}\right) \subset \mathrm{G}_{j}$ and $s\left(\mu_{j, \omega^{\prime}}^{\prime}\right) \subset \mathrm{G}_{j}$ for all $j \geqslant 1 ; \omega \in \Omega, \quad \omega^{\prime} \in \Omega^{\prime}$.
(1.ii) For all $\omega \in \Omega$ and $\omega^{\prime} \in \Omega^{\prime}$ we have:

$$
\mu_{\omega} \geqslant 0, \quad \mu_{\omega^{\prime}}^{\prime} \geqslant 0 ; \quad\left\|\mu_{\omega}\right\|=\left\|\mu_{\omega^{\prime}}^{\prime}\right\|=1
$$

(1.iii) For each $\chi \in \hat{\mathrm{G}}, \quad\left\{\hat{\mu}_{j}(\chi)\right\}_{j=1}^{\infty}$ (resp. $\left.\left\{\hat{\mu}_{j}^{\prime}(\chi)\right\}_{j=1}^{\infty}\right)$ is a sequence of (complex) independent random variables defined on the probability space $\Omega\left(\operatorname{resp} \Omega^{\prime}\right)$ and we have:

$$
\hat{\mu}(\chi)=\prod_{j=1}^{\infty} \hat{\mu}_{j}(\chi) \quad \text { and } \quad \hat{\mu}^{\prime}(\chi)=\prod_{j=1}^{\infty} \hat{\mu}_{j}^{\prime}(\chi)
$$

from that it follows at once that for all $r \in \mathbf{Z}, r \geqslant 1$ :

$$
\mathbf{E}|\hat{\mu}(\gamma)|^{r}=\prod_{j=1}^{\infty} \mathbf{E}\left|\hat{\mu}_{j}\left(\chi_{j}\right)\right|^{r} \quad \text { and } \quad \mathbf{E}\left|\hat{\mu}^{\prime}(\chi)\right|=\prod_{j=1}^{\infty} \mathbf{E}\left|\hat{\mu}_{j}^{\prime}(\chi)\right|
$$

1. iv) Let us assume that $\chi \in \hat{G}$ is an element of finite order or equivalently that $m=\mid \mathrm{G} /$ ker $\chi \mid<+\infty$ then we see at once that if $m_{j}=\mid \mathrm{G}_{j} / \mathrm{G}_{j} \cap$ ker $\chi \mid$ then :

$$
\mathbf{E}\left|\hat{\mu}_{j}(\chi)\right|^{r}=\sigma\left(r ; m_{j}\right)
$$

(1.v) In the particular case when for some $N \in \mathbf{Z}, \mathrm{~N} \geqslant 1$

$$
\mathrm{G}=\prod_{n=1}^{\infty} \mathrm{G}^{(n)} \quad \text { with } \quad \mathrm{G}^{(n)} \cong \mathbf{Z}\left(2^{\mathrm{N}}\right) \quad(n \geqslant 1)
$$

and
$\mathrm{G}_{j}=\prod_{n \geqslant \mathrm{~A}_{j}} \mathrm{G}^{(n)} \quad$ for $\quad j \geqslant 1 \quad$ and $\quad 1 \leqslant \mathrm{~A}_{1} \leqslant \mathrm{~A}_{2} \leqslant \cdots$.
We have for every $\chi \in \hat{G}$

$$
\mathbf{E}\left|\hat{\mu}_{j}^{\prime}(\chi)\right|=\left\{\begin{array}{lll}
1 & \text { if } & \chi \mid \mathrm{G}_{j} \equiv 1 \\
\alpha_{j}(\chi)<1 & \text { if } & \chi \mid \mathrm{G}_{j} \equiv \equiv 1
\end{array}\right.
$$

and observe that just as above

$$
\alpha_{j}(\chi)=\alpha\left(m_{j}\right)=\frac{1}{2 m_{j}^{2}} \sum_{0 \leq \alpha, \beta \leqslant m_{j}-1}\left|\exp \frac{2 \pi \alpha i}{m_{j}}+\exp \frac{2 \pi \beta i}{m_{j}}\right|
$$

depends only on $m_{j}=\mid \mathrm{G}_{j} / \mathrm{G}_{j} \cap$ ker $\chi \mid$ which can take only the values $2,4, \ldots, 2^{\mathrm{N}}$ if $\chi \mid \mathrm{G}_{j} \equiv \equiv 1$. So there exists $\alpha=\sup _{1 \leqslant k \leqslant \mathrm{~s}} \alpha\left(2^{k}\right)$ independent of $\chi$ and $j$ such that

$$
\chi \mid \mathrm{G}_{j} \equiv \equiv 1 \Longrightarrow \alpha_{j}(\chi) \leqslant \alpha<1 .
$$

We now prove some lemmas.
Lemma 1.1 (only needed for $\S 4$ ). - Let $\mathrm{X} \subset \hat{\mathrm{G}}$ be a set of characters of G and assume that

$$
\sum_{\chi \in \mathbf{x}} \mathbf{E}|\hat{\mu}(\chi)|<+\infty \quad\left(\text { resp } . \sum_{\chi \in \mathbf{x}} \mathbf{E}\left|\hat{\mu}^{\prime}(\chi)\right|<+\infty\right)
$$

then almost surely $\hat{\mu}(\chi) \xrightarrow[\chi \in \mathrm{X} ; \chi \rightarrow \infty]{ } 0$ (resp. almost surely $\left.\hat{\mu}^{\prime}(\chi) \xrightarrow[\chi \in \mathbf{X} ; \chi \rightarrow \infty]{ } 0\right)$.

Proof. - We prove the result for the $\Omega$-random measures, the one for $\Omega^{\prime}$-random measures is proved identically.

Using the elementary properties of mathematical expectation we see that (observe $|\mathrm{X}| \leqslant|\hat{\mathrm{G}}| \leqslant \boldsymbol{N}_{0}$ ):

$$
\mathbf{E}\left\{\sum_{\chi \in \mathbf{X}}|\hat{\mu}(\chi)|\right\}=\sum_{\chi \in \mathbf{x}} \mathbf{E}|\hat{\mu}(\chi)|<+\infty
$$

thus almost surely:

$$
\sum_{x \in \mathbf{x}}|\hat{\mu}(\chi)|<+\infty \Longrightarrow \text { almost surely } \hat{\mu}(\chi) \xrightarrow[\chi \in \mathbf{x} ; x \rightarrow \infty]{ } 0
$$

Lemma 1.2. - Suppose that there exists a family of positive integers $\left\{\rho_{\chi}\right\}_{\chi \in \hat{G}}$ such that for all values of $\lambda \geqslant 0$

$$
\sum_{\chi \in \hat{\mathrm{a}}} \lambda \lambda_{0} \mathbf{E}|\hat{\mu}(\chi)|^{\rho_{x}}<+\infty .
$$

Then almost surely:

$$
\hat{\mu}(\chi) \underset{\chi \rightarrow \infty}{\longrightarrow} 0 .
$$

Proof. - Just as in the proof of Lemma 1.1 we have for all $\lambda \geqslant 0$

$$
\mathbf{E}\left\{\left.\sum_{\chi \in \hat{\mathrm{a}}} \lambda^{\rho_{x} \mid \hat{\mu}}(\chi)\right|^{\rho_{x}}\right\}=\sum_{\chi \in \hat{\mathrm{G}}} \lambda \rho_{\chi} \mathbf{E}|\hat{\mu}(\chi)|^{\rho_{x}}<+\infty
$$

and almost surely:

$$
\sum_{\chi \in \hat{\mathrm{a}}} \lambda \rho_{1}|\hat{\mu}(\chi)|^{\rho_{x}}<+\infty
$$

From that we conclude that almost surely :

$$
\varlimsup_{\chi \rightarrow \infty}|\hat{\mu}(\chi)| \leqslant \frac{1}{\lambda}
$$

and $\lambda$ being arbitrary it suffices to take a sequence $\lambda_{n} \xrightarrow[n \rightarrow \infty]{ } \infty$ to obtain the required result.

Lemma 1.3. - Suppose that $\Sigma$ in G is such that:

$$
\frac{\lim }{n} \frac{\log h_{G}\left(\mathrm{G}_{n}\right)}{n}=-\infty
$$

then for all $\omega \in \Omega$ and all positive integer $r$ we have:

$$
h_{\mathrm{G}}\left[r s\left(\mu_{\omega}\right)\right]=0
$$

and thus since $s\left(\mu_{\omega}\right)=-s\left(\mu_{\omega}\right)$ se have:

$$
h_{\mathrm{G}}\left[\mathrm{G} p\left(s\left(\mu_{\omega}\right)\right)\right]=0
$$

Proof. - We have in general for all $\mathrm{N} \in \mathbf{Z}, \mathrm{N} \geqslant 1$ and $\omega \in \Omega$ :

$$
r s\left(\mu_{\omega}\right) \subseteq \sum_{j=1}^{\mathrm{N}} r s\left(\mu_{j, \omega}\right)+\mathrm{G}_{\mathrm{N}}
$$

and thus :
$h_{\mathrm{G}}\left[r s\left(\mu_{\omega}\right)\right] \leqslant 2^{r \mathrm{~N}} h_{\mathrm{G}}\left(\mathrm{G}_{\mathrm{N}}\right)=\exp \left\{r(\log 2) \mathrm{N}+\log h_{\mathrm{G}}\left(\mathrm{G}_{\mathrm{N}}\right)\right\}=\mathrm{K}_{\mathrm{N}} ;$ and by the hypothesis we have $\frac{\lim }{\mathrm{N}} \mathrm{K}_{\mathrm{N}}=0$. That proves the result.

Now let $G$ be of the form $G=\prod_{n=1}^{\infty} G_{n}$ for $G_{n}$ compact abelian groups. And let $\mathcal{G}=\left\{g_{n} \in \mathrm{G}_{n} \subset \mathrm{G}\right\}_{n=1}^{\infty}$ and

$$
\mathscr{K}=\left\{K_{n} \in \mathbf{Z}\right\}_{n=1}^{\infty} \quad \text { such that } \quad K_{1}=1
$$

$\mathrm{K}_{n+1}>\mathrm{K}_{n} \quad n \geqslant 1$.
Definition $\Lambda^{\prime}$ (only needed for $\S 4$ ). - With $\mathcal{G}$ and $\mathcal{K}$ spe associate a sequence of measures of $G\left\{\lambda_{n}\right\}_{n=1}^{\infty}$ defined by:

$$
\begin{gathered}
\lambda_{n} \geqslant 0, \quad\left\|\lambda_{n}\right\|=1, \quad s\left(\lambda_{n}\right)=\bigcup_{\mathbf{K}_{n} \leqslant j<\mathbf{K}_{n+1}}\left(g_{j} \cup g_{j}^{-1}\right), \\
x \in s\left(\lambda_{n}\right) \Longrightarrow \lambda_{n}(\{x\})=\frac{1}{\left|s\left(\lambda_{n}\right)\right|} ; \quad \text { for } \quad n \geqslant 1
\end{gathered}
$$

we also define:
and we call it the $\Lambda(=\Lambda[\mathrm{G} ; \mathcal{G}, \mathcal{K}])$-measure associated to $\mathcal{G}$ and $\mathfrak{K}$; and $\lambda_{j}$ we call its $j^{\text {th }}$ component.

Definition $\Lambda$ (only needed for §4). - With $\mathcal{G}$ and $\mathfrak{K}$ we associate a sequence of measures of $G\left\{\lambda_{n}^{\prime}\right\}_{n=1}^{\infty}$ defined by:

$$
\begin{gathered}
\lambda_{n}^{\prime} \geqslant 0, \quad\left\|\lambda_{n}^{\prime}\right\|=1, \quad s\left(\lambda_{n}^{\prime}\right)=\bigcup_{\mathbf{k}_{n} \leqslant j<\mathbf{K}_{n+1}} g_{j} \cup \mathrm{O}_{\mathrm{G}} \\
x \in s\left(\lambda_{n}^{\prime}\right) \Longrightarrow \lambda_{n}^{\prime}(\{x\})=\frac{1}{\left|s\left(\lambda_{n}^{\prime}\right)\right|} ; \quad \text { for } \quad n \geqslant 1
\end{gathered}
$$

we also define:
and we call it the $\Lambda^{\prime}\left(=\Lambda^{\prime}[G ; \mathcal{G}, \mathfrak{K}]\right)$-measures associated to $\mathcal{G}$ and $\Re_{\text {; }}$ and $\lambda_{j}^{\prime}$ we call its $j^{\text {th }}$ component.

Remarks. - (1.vi) we have:

$$
\lambda \geqslant 0, \quad \lambda^{\prime} \geqslant 0 ; \quad\|\lambda\|=\left\|\lambda^{\prime}\right\|=1
$$

(1.vii) for all $\chi \in \hat{\mathrm{G}}$ we have:

$$
\hat{\lambda}(\chi)=\prod_{j=1}^{\infty} \hat{\lambda}_{j}(\chi) \quad \text { and } \quad \hat{\lambda}^{\prime}(\chi)=\prod_{j=1}^{\infty} \hat{\lambda}_{j}^{\prime}(\chi)
$$

we finish this paragraph with a very technical:
Lemma 1.4 (only needed for § 4 and §5). - Suppose $\mathrm{G}=\prod_{n=1}^{\infty} \mathrm{G}_{n}$ with $\mathrm{G}_{n}=\mathbf{Z}\left(p^{\mathrm{N}_{n}}\right)$ for some fixed prime $p$, and $1 \leqslant \mathrm{~N}_{1} \leqslant \mathrm{~N}_{2} \leqslant \cdots$ positive integers.

Suppose $\mathscr{L}=\left\{\mathrm{L}_{n}\right\}_{n=1}^{\infty}$ is a non decreasing sequence of positive integers such that:

$$
\lim _{n \rightarrow \infty} \frac{\mathrm{~L}_{n}}{n \log \log n}=+\infty
$$

Suppose further that $\left\{\oint_{n}^{k} \in \mathrm{M}(\mathrm{G})\right\}_{n=1}^{\infty}, 1 \leqslant k \leqslant r$, are $r$ families of Radon measures on $G$ such that:

$$
\varphi_{n}^{k} \geqslant 0 \quad \text { and } \quad\left\|\varphi_{n}^{k}\right\|=1 \quad \text { for } \quad n \geqslant 1 ; 1 \leqslant k \leqslant r
$$

$$
\text { (§) } \quad\left|s\left(\varphi_{n}^{k}\right)\right|=0(\log n) \quad \text { as } \quad n \rightarrow \infty \text { for } \quad 1 \leqslant k \leqslant r
$$

under the above conditions if we denote by:

$$
\varphi^{k}={\underset{n=1}{\infty} \varphi_{n}^{k} \quad \text { and by } \quad \varphi=\underset{k=1}{\underset{k}{k}} \varphi^{k} . ~ . ~ . ~}_{\text {. }}
$$

Then for all $m \in \mathbf{Z}$ se have:

$$
\tau_{m}(\mathrm{G}) \neq \mathrm{O}_{\mathrm{G}} \Longrightarrow h_{\mathrm{G}}[g \in \mathrm{G} ; \quad m g \in \mathrm{G} p(s(\varphi))]=0
$$

Proof. - The convergence for the vague topology of the $\underset{n=1}{\infty} \varphi_{n}^{k}(1 \leqslant k \leqslant r)$ is assured by ( $\alpha$ ) and ( $\gamma$ ). Let us now denote for all $R \in \mathbf{Z}, \mathrm{R} \geqslant 1$;

$$
\Gamma_{\mathrm{R}}=\sum_{k=1}^{r} \mathrm{R} s\left(\varphi^{k}\right)-\sum_{k=1}^{r} \mathrm{R} s\left(\varphi^{k}\right)
$$

and observe that:

$$
\begin{equation*}
\mathrm{G} p(s(\varphi))=\bigcup_{\mathbf{R} \geqslant 1} \Gamma_{\mathbf{R}} \tag{1.3}
\end{equation*}
$$

also for all $n \in \mathbf{Z} n \geqslant 1$ and $1 \leqslant k \leqslant r$ we have :

$$
s\left(\varphi^{k}\right) \subset \sum_{j=1}^{n} s\left(\varphi_{j}^{k}\right)+\prod_{j \geqslant \mathbf{L}_{n}} \mathrm{G}_{j}
$$

thus:

$$
\begin{equation*}
\Gamma_{\mathbf{R}} \subset \mathrm{D}_{\mathrm{R}}^{n}+\prod_{j \geqslant \mathrm{~L}_{n}} \mathrm{G}_{j} \tag{1.4}
\end{equation*}
$$

where :

$$
\mathrm{D}_{\mathrm{R}}^{n}=\sum_{k=1}^{r} \sum_{j=1}^{n} \mathrm{R} s\left(\varphi_{j}^{k}\right)-\sum_{k=1}^{r} \sum_{j=1}^{n} \mathrm{R} s\left(\varphi_{j}^{k}\right)
$$

and using condition ( $\delta$ ) we see at once that:

$$
\begin{equation*}
\log \left|D_{\mathrm{R}}^{n}\right|=0(n \log \log n) \tag{1.5}
\end{equation*}
$$

Let us now fix $\zeta \in \mathbf{Z} \zeta \geqslant 0$ such that $\tau_{p \zeta}(\mathrm{G}) \neq \mathrm{O}_{\mathrm{G}}$ then we have for all $t \in \mathrm{G}$ :

$$
=\left\{\prod_{j=1}^{\mathbf{L}_{n}-1}\left|\tau_{p^{\prime}}\left(\mathrm{G}_{j}\right)\right|\right\}^{-1} \leqslant p^{-\mathbf{L}_{n}+\mathrm{C}_{\zeta}}
$$

where $\mathrm{C}_{\zeta}$ is a constant (depending on $\zeta$ ).
Now putting (1.4), (1.5) and (1.6) together we see that:

$$
h_{\tau_{p^{r}}^{\gamma}(\mathrm{G})}\left[\Gamma_{\mathrm{R}} \cap \tau_{p^{\zeta}(\mathrm{G})}\right) \leqslant \mathrm{C} \exp \left(\mathrm{C}_{1} n \log \log n-\mathrm{C}_{2} \mathrm{~L}_{n}\right) \xrightarrow[n \ngtr \infty]{ } 0
$$

by condition ( $\alpha$ ). And using (1.3) we see that:

Now if $q \not \equiv 0(\bmod p), \tau_{q}$, is an automorphism of G (It is (1-1) continuous and $\left.\tau_{q}(\mathrm{G}) \supset \sum_{n=1}^{\infty} \mathrm{G}_{n}\right)$ and thus preserves the measure of sets; that observation combined with (1.7) completes the proof of the Lemma.
2. The case $\mathrm{G}=\prod_{n=1}^{\infty} \mathbf{Z}\left(p_{n}\right)$ for a «very rapidly incrasing » sequence of primes $\left\{p_{n}\right\}_{n=1}^{\infty}$.

Definition. - $A$ sequence of primes $\left\{p_{n}\right\}_{n=1}^{\infty}$ will be called very rapidly increasing if the following conditions are satisfied.

$$
p_{n+1}>p_{1} p_{2} \ldots p_{n} \quad \text { for } \quad n \geqslant 1 .
$$

( $\beta$ ) If $q_{n}=\left[\frac{\log p_{n}}{n}\right]$ the integral part of $\frac{\log p_{n}}{n}$ then $q_{n+1}>q_{n}$ for $n \geqslant 1$.

$$
p_{n} \geqslant \exp \left(e^{n^{2}}\right) \quad \text { for } \quad n \geqslant 1
$$

Remarks (2.i). - Observe that given an arbitrary sequence of primes $\left\{r_{n}\right\}_{n=1}^{\infty}$ such that $\sup r_{n}=+\infty$ we can extract a subsequence $\left\{r_{n j}\right\}_{j=1}^{\infty}$ which is very rapidly increasing (with $j$ ). We can now state:

Theorem $\Pi_{1}$. - If $\left\{p_{n}\right\}_{n=1}^{\infty}$ is a very rapidly increasing $\begin{aligned} & \text { sequence of primes and if } \mathrm{G}=\prod_{n=1}^{\infty} \mathrm{G}^{(n)} \text { with } \mathrm{G}^{(n)}=\mathbf{Z}\left(p_{n}\right) \\ & \text { then } \mathrm{G} \text { has S-measures. }\end{aligned}$.

Proof. - Let us define for all $n \in \mathbf{Z}, n \geqslant 1$ :

$$
\mathrm{K}_{n}=\inf \left\{r \in \mathbf{Z} ; r \geqslant 1, \frac{\log p_{r}}{r} \geqslant n\right\}
$$

and observe at once that:

$$
\mathrm{K}_{1}=1 \quad \text { and } \quad \mathrm{K}_{n} \uparrow \infty
$$

Using condition ( $\beta$ ) of the definition, an preserving the notation $q_{n}=\left[\frac{\log p_{n}}{n}\right]$, we see that for all $n \in \mathbf{Z}, n \geqslant 1$ :
(2.1) $\left\{r \in \mathbf{Z} ; \mathrm{K}_{r}=n+1\right\}=\left\{r \in \mathbf{Z} ; q_{n}<r \leqslant q_{n+1}\right\} \neq \varnothing ;$ and from that we deduce at once that for all $n \in \mathbf{Z}, n \geqslant 1$ :

$$
\begin{equation*}
\left|\left\{j \in \mathbf{Z} ; \quad j \geqslant 1, \mathrm{~K}_{j} \leqslant n+1\right\}\right|=\sup _{\mathbf{K}_{j} \leqslant n+1}^{=} \underset{\mathbf{x}_{j}=n+1}{ } \sup _{n+1} j=q_{n+1} . \tag{2.2}
\end{equation*}
$$

Let us now define a series of subgroups of G :

$$
\Sigma \quad \mathrm{G}=\mathrm{G}_{0} \supseteq \mathrm{G}_{1} \supseteq \cdots \supseteq \mathrm{G}_{n} \supseteq \cdots \supseteq \bigcap_{n=1}^{\infty} \mathrm{G}_{n}=\left\{\mathrm{O}_{G}\right\}
$$

by

$$
\mathrm{G}_{n}=\prod_{j \geqslant \mathbf{x}_{n}} \mathrm{G}^{(j)} \quad \text { for all } \quad n \geqslant 1 .
$$

We shall prove the theorem $\Pi_{1}$ by proving the following fact:
«The $\Omega$-random measure $\mu=\mu_{\omega}$ associated to the series $\Sigma$ is almost surely an S-measure of G. "

Towards that taking (2.1) and condition $(\gamma)$ of the definition into account we see that

$$
\varlimsup_{n}\left\{\left(\log p_{\mathbf{x}_{n}-1}\right) n^{-1}\right\} \geqslant \lim _{m}\left\{\left(\log p_{m}\right)\left(q_{m}+1\right)^{-1}\right\}=+\infty
$$

and that together with $h_{\mathrm{G}}\left(\mathrm{G}_{n}\right)=\left(p_{1} p_{2} \ldots p_{\mathbf{K}_{n}-1}\right)^{-1}$ implies that $\lim _{n} \frac{\log h_{\mathrm{G}}\left(\mathrm{G}_{n}\right)}{n}=-\infty$ and thus taking Lemma 1.3 into acount we see that for all $\omega \in \Omega$ :

$$
\begin{equation*}
h_{G}\left[\mathrm{G} p\left(s\left(\mu_{\omega}\right)\right)\right]=0 . \tag{2.3}
\end{equation*}
$$

Let us now define for all $\chi \in \hat{\mathrm{G}}$ :
$\nu_{\chi}=\sup \left\{r \in \mathbf{Z} ; \quad \chi \mid \prod_{j \geqslant r} G^{(j)} \equiv \equiv 1\right\} \quad$ if $\quad \chi \neq 0_{\hat{G}} ; \quad \nu_{0_{\hat{G}}}=0$ and :

$$
\rho_{x}=e^{\nu_{z}^{2}}
$$

and let us observe at once that for $j \geqslant 1$ :

$$
\begin{equation*}
\mathrm{K}_{j} \leqslant \nu_{\chi} \Rightarrow \infty>\left|\mathrm{G}_{j} / \mathrm{G}_{j} \cap \operatorname{Ker} \chi\right| \geqslant p_{\nu_{j}} ; \tag{2.4}
\end{equation*}
$$

and
(2.5) $\quad\left|\left\{\chi \in \hat{G} ; \nu_{\chi}=j\right\}\right|=p_{1} p_{2} \ldots p_{j-1}\left(p_{j}-1\right)$.

Now in general using (1. iii) and (1.iv) we see that:
(2.6) $\mathbf{E}|\hat{\mu}(\chi)|^{\rho_{\chi}}=\prod_{j=1}^{\infty} \mathrm{E}\left|\hat{\mu}_{j}(\chi)\right|^{\rho_{\chi}}=\prod_{\mathbf{K}_{j} \leq v_{k}} \mathrm{E}\left|\hat{\mu}_{j}(\chi)\right|^{\rho_{\chi}}=\prod_{\mathbf{x}_{j} \leq v_{k}} \sigma\left(\rho_{\chi} ; m_{j}\right)$
where $m_{j}=\mid \mathrm{G}_{j} / \mathrm{G}_{j} \cap$ ker $\chi \mid$ and where an empty product is interpreted as 1.

Now using (1.1) and (1.2) we see that for all $\mathrm{N}, m \in \mathbf{Z}$, $\mathrm{N} \geqslant 1, m \geqslant p_{\mathrm{N}}$
(2.7) $\quad \sigma\left(e^{\mathrm{N}^{2}} ; m\right) \leqslant \sigma\left(e^{\mathrm{N}^{2}}\right)+\frac{\mathrm{C}_{1} e^{\mathrm{N}^{2}}}{m} \leqslant \mathrm{C}_{2} e^{-\frac{\mathrm{N}^{2}}{2}}+\frac{\mathrm{C}_{1} e^{\mathrm{N}^{2}}}{p_{\mathrm{v}}} \leqslant \mathrm{C} e^{-\frac{\mathrm{N}^{2}}{2}}$
putting (2.4) (2.6) and (2.7) together and using (2.2) we see that: for $\nu_{\chi}=\mathrm{N} \geqslant 2$ :

$$
\begin{aligned}
& \mathbf{E}|\hat{\mu}(\chi)|^{\rho_{\mathrm{\chi}}} \leqslant \exp \left\{\left(\log \mathrm{C}-\frac{\mathrm{N}^{2}}{2}\right)\left|\left\{j \in \mathbf{Z} ; j \geqslant 1, \mathrm{~K}_{j} \leqslant \mathrm{~N}\right\}\right|\right\} \\
&=\exp \left\{\left(\log \mathrm{C}-\frac{\mathrm{N}^{2}}{2}\right) q_{\mathrm{N}}\right\}
\end{aligned}
$$

from that and (2.5) and conditions ( $\alpha$ ) ( $\gamma$ ) of the definition we deduce that for $\mathrm{N} \geqslant 2$

$$
\begin{array}{r}
\text { (2.8) } \begin{array}{r}
\sum_{\gamma_{1}=\mathrm{N}} \mathbf{E}|\hat{\mu}(\chi)|^{\rho_{\mathrm{N}}} \leqslant p_{1} p_{2} \ldots p_{\mathrm{N}} \exp \left\{\left(\log \mathrm{C}-\frac{\mathrm{N}^{2}}{2}\right) q_{\mathrm{N}}\right\} \\
\leqslant p_{\mathrm{N}}^{2} \exp \left\{\left(\log \mathrm{C}-\frac{\mathrm{N}^{2}}{2}\right) q_{\mathrm{v}}\right\}=\exp \left\{2 \log p_{\mathrm{N}}+\left(\log \mathrm{C}-\frac{\mathrm{N}^{2}}{3}\right) q_{\mathrm{N}}\right\} \\
=0\left\{\exp \left(-\frac{\mathrm{N}}{3} e^{\mathrm{N}^{\mathrm{N}}}\right)\right\}
\end{array} \tag{2.8}
\end{array}
$$

and from that it follows that for all $\lambda \geqslant 0$

Therefore the conditions of Lemma 1.2 are satisfied and so the $\Omega$-random measure $\mu=\mu_{\omega} \in \mathrm{M}_{0}(\mathrm{G})$ almost surely. If we combine that with (2.3) and with remark (1.ii) we have the required result that almost surely $\mu$ is an S-measure of G.

## 3. The case $\mathbf{G}-\mathbf{U}(p)$ the p-adic integers.

Theorem U. - For any prime p the compact additive group of $p$-adic integers $\mathbf{U}(p)$ has S-measures.

Proof. - We fix the prime $p$ once and for all, and write $\mathrm{G}=\mathbf{U}(p)$ for the group of $p$-adic integers. Observe then that:
$\mathrm{G}=\mathbf{U}(p)=\lim _{\varliminf_{n}} \mathbf{Z}\left(p^{n}\right) \quad$ and that $\quad \hat{\mathrm{G}}=\mathbf{Z}\left(p^{\infty}\right)=\underset{n}{\lim } \mathbf{Z}\left(p^{n}\right)$
more explicitly to the ascending chain of $\hat{\mathrm{G}}$ :

$$
\left\{\mathrm{O}_{\mathrm{G}}\right\} \subseteq \mathbf{Z}(p) \subseteq \mathbf{Z}\left(p^{2}\right) \subseteq \cdots \subseteq \mathbf{Z}\left(p^{n}\right) \subseteq \cdots \subseteq \mathbf{Z}\left(p^{\infty}\right)=\hat{\mathrm{G}}
$$

corresponds the polar descending chain of G :
$\mathrm{G} \supseteq(\mathbf{Z}(p))^{0} \supseteq\left(\mathbf{Z}\left(p^{2}\right)\right)^{\mathrm{o}} \supseteq \cdots \supseteq\left(\mathbf{Z}\left(p^{n}\right)\right)^{0} \supseteq \cdots \supseteq\left\{\mathrm{O}_{\mathrm{G}}\right\}=(\hat{\mathrm{G}})^{\mathrm{o}}$
and of course for $n<m$

$$
\left(\mathbf{Z}\left(p^{n}\right)\right)^{0} /\left(\mathbf{Z}\left(p^{m}\right)\right)^{0} \cong \mathbf{Z}\left(p^{m-n}\right)
$$

Let us also observe that for positive integers M and N :
(3.1) $\quad \chi \in\left(\mathbf{Z}\left(p^{\mathbf{M}}\right)\right) \backslash\left(\mathbf{Z}\left(p^{\mathbf{M}-\mathbf{1}}\right)\right) \subset \hat{\mathrm{G}}$

$$
\Longrightarrow\left|\left(\mathbf{Z}\left(p^{\mathbb{N}}\right)\right)^{0} /\left(\mathbf{Z}\left(p^{\mathbf{N}}\right)\right)^{0} \cap \operatorname{Ker} \chi\right|=p^{\mathrm{spp}\{\mathrm{M}-\mathrm{N}, \mathbf{O}\}} .
$$

We shall denote now for all $n$ positive integer :

$$
\mathrm{K}_{n}=\left[n(\log n)^{1 / 4}\right]=\text { the integral part of } n(\log n)^{1 / 4}
$$

and let us observe that:

$$
\mathrm{K}_{1}=0 \quad \text { and } \quad \mathrm{K}_{n} \uparrow \infty
$$

Also for arbitrary $\alpha \geqslant 0$ we verify that there exists $n_{0}=n_{0}(\alpha)$
s.t. for $n \geqslant n_{0}$ we have:

$$
\begin{align*}
& \left|\left\{j \in \mathbf{Z} ; j \geqslant 1, \mathrm{~K}_{j} \leqslant n-\alpha \log n\right\}\right|  \tag{3.2}\\
& \quad=\sup \left\{j \in \mathbf{Z} ; \mathrm{K}_{j} \leqslant n-\alpha \log n\right\} \geqslant \frac{n}{(\log n)^{1 / 2}} .
\end{align*}
$$

Let us now define a series of subgroups:

$$
\mathrm{\Sigma} \quad \mathrm{G}=\mathrm{G}_{0} \supseteq \mathrm{G}_{1} \supseteq \cdots \supseteq \mathrm{G}_{n} \supseteq \cdots \supseteq \bigcap_{n=1}^{\infty} \mathrm{G}_{n}=\left\{\mathrm{O}_{\mathrm{G}}\right\}
$$

by

$$
\mathrm{G}_{n}=\left(\mathbf{Z}\left(p^{\mathbf{K}_{n}}\right)\right)^{0} \quad \text { for } \quad n \geqslant 1 .
$$

We shall prove Theorem $U$ by proving that:
"The $\Omega$-random measure $\mu=\mu_{\omega}$ associated with $\Sigma$ is almost surely an S-measure."

Towards that we observe that since

$$
\log h_{\mathrm{G}}\left(\mathrm{G}_{n}\right)=-(\log p) \mathrm{K}_{n} \quad \text { and since } \quad \frac{\mathrm{K}_{n}}{n} \xrightarrow[n \rightarrow \infty]{ } \infty
$$

the conditions of Lemma 1.3 are satisfied and so for all $\omega \in \Omega$ we have:

$$
\begin{equation*}
h_{\mathrm{G}}\left[\mathrm{G} p\left(s\left(\mu_{\omega}\right)\right)\right]=0 \tag{3.3}
\end{equation*}
$$

Let us now define for all $\chi \in \hat{\mathrm{G}}$ :

$$
\rho_{\chi}=\inf \left\{r \in \mathbf{Z} ; \quad \chi \in \mathbf{Z}\left(p^{r}\right) \subseteq \hat{G}\right\}
$$

we have for: $\mathrm{N} \in \mathrm{Z}, \mathrm{N} \geqslant 1$ :
(3.4) $\left|\left\{\chi \in \hat{\mathrm{G}} ; \rho_{\chi}=\mathrm{N}\right\}\right|=\left|\mathbf{Z}\left(p^{\mathrm{N}}\right) \backslash \mathbf{Z}\left(p^{\mathrm{N}-1}\right)\right|=(p-1) p^{\mathrm{N}-1}$.

Now using remarks (1.iii) and (1.iv) and (3.1) we see that: for $\chi \neq 0_{\hat{G}}$ :
(3.5) $\mathbf{E}|\hat{\mu}(\chi)|^{\rho_{\chi}}=\prod_{\mathbf{k}_{j} \leqslant \rho_{i}} \sigma\left(\rho_{\chi} ; p^{\rho_{1}-\mathbf{K}_{j}}\right)$

$$
\leqslant \prod_{\mathbf{K}_{j} \leqslant p_{1}-\alpha<\log \rho_{k}} \sigma\left(\rho_{x} ; p^{\rho_{k}-\mathbb{K}_{j}}\right)
$$

where $\alpha=\frac{3}{2}(\log p)^{-1}$ and where empty products are interpreted as 1. But with that choice of $\alpha$ using (1.1) and (1.2) we see that: for

$$
\begin{aligned}
\mathrm{N} \geqslant 1, \quad \mathrm{~K}_{j} \leqslant \mathrm{~N}-\alpha \log \mathrm{N} \Longrightarrow \frac{\mathrm{~N}}{p^{\mathrm{N}-\mathrm{K}_{j}}} & \leqslant \frac{1}{\sqrt{\bar{N}}} \\
& \Longrightarrow \sigma\left(\mathrm{~N} ; p^{\mathbf{N}-\mathrm{K}_{j}}\right) \leqslant \frac{\mathrm{C}}{\sqrt{\bar{N}}}
\end{aligned}
$$

which together with (3.2) and (3.5) implies that there exists. $\mathrm{N}_{0}$ such that for $\mathrm{N} \geqslant \mathrm{N}_{0}$ and $\rho_{\chi}=\mathrm{N}$ :

$$
\mathbf{E}|\hat{\mu}(\chi)|^{\rho x} \leqslant\left(\frac{\mathrm{C}}{\sqrt{\mathrm{~N}}}\right)^{\left\|j \in \mathbf{Z} ; j \geqslant 1, \mathbf{K}_{j} \leqslant \mathrm{~N}-\alpha \log \mathrm{N}\right\|} \leqslant\left(\frac{\mathrm{C}}{\sqrt{\mathrm{~N}}}\right)^{\frac{\mathrm{N}}{(\operatorname{L\operatorname {Log}\mathrm {N})/|/2}}}
$$

and from that we deduce using (3.4) that:

$$
\left.\begin{array}{rl}
\sum_{\rho_{x}=\mathrm{N}} \mathbf{E} \mid \hat{\mu}(\chi) \rho^{\rho x} & \leqslant p^{\mathrm{N}}\left(\frac{\mathrm{C}}{\sqrt{\mathrm{~N}}}\right)^{\frac{\mathrm{N}}{(\log \mathrm{~N})^{1 / 2}}} \\
& \leqslant \exp \{(\log p) \mathrm{N}
\end{array}+\left(\log \mathrm{C}-\frac{1}{2} \log \mathrm{~N}\right) \frac{\mathrm{N}}{(\log \mathrm{~N})^{1 / 2}}\right\} .
$$

And that implies that for all $\lambda \geqslant 0$ :

$$
\sum_{\chi \in \hat{\mathrm{Q}}} \lambda^{\mathrm{e}_{\mathrm{K}} \mathrm{E}}|\hat{\mu}(\chi)|^{\rho_{\chi}}=\sum_{\mathrm{N}} \lambda^{\mathrm{N}} \sum_{\rho_{\ell}=\mathrm{N}} \mathbf{E}|\hat{\mu}(\chi)|^{\rho_{X}}<+\infty .
$$

Therefore the conditions of Lemma 1.2. are satisfied and thus almost surely $\mu=\mu_{\omega} \in M_{0}(G)$. That fact combined with (3.3) and remark (1.ii) implies that almost surely the $\Omega$-random measure $\mu$ is an S -measure of G .
4. The case $\mathrm{G}=\prod_{j=1}^{\infty} \mathrm{G}^{(j)}$ for $\mathrm{G}^{(j)}=\mathrm{Z}\left(p^{\mathrm{N}}\right)$ for some fixed prime
and some fixed $\mathrm{N} \in \mathrm{Z}, \mathrm{N} \geqslant 1$.

Theorem $\Pi_{2}$. - If $\mathrm{G}=\prod_{j=1}^{\infty} \mathrm{G}^{(j)}$ where $\mathrm{G}^{(j)}=\mathbf{Z}\left(p^{\mathbb{N}}\right)$ for some fixed prime $p$ and some fixed $\mathrm{N} \in \mathbf{Z}, \mathrm{N} \geqslant 1$; then G has $\mathrm{S}^{*}$-measures.

Proof. - Let us fix once and for all : $\Re=\left\{\mathrm{K}_{j} \in \mathbf{Z}\right\} \underset{j=1}{\infty}$ satisfying the following conditions:

$$
1=\mathrm{K}_{1}<\mathrm{K}_{2}<\cdots<\mathrm{K}_{n}<\cdots, \quad \mathrm{K}_{n+1}-\mathrm{K}_{n} \uparrow
$$

$$
\begin{align*}
& \mathrm{K}_{n} \sim n \log n \quad(n \rightarrow \infty),  \tag{4.1}\\
&\left(\mathrm{K}_{n+1}-\mathrm{K}_{n}-\log n\right)=0(1) \quad(n \rightarrow \infty)
\end{align*}
$$

but arbitrary otherwise,

$$
\text { (e.g. set } \left.\mathrm{K}_{j+1}-\mathrm{K}_{j}=[\log i]+1 \quad(j \geqslant 1)\right) .
$$

Observe now that:

$$
\hat{\mathbf{G}}=\sum_{j=1}^{\infty} \hat{\mathbf{G}}^{()} \quad \text { and } \quad \hat{\mathbf{G}}^{())} \cong \mathbf{Z}\left(p^{\mathbf{N}}\right) ;
$$

for $\chi \in \hat{\mathrm{G}}$ let us introduce :
$\nu_{\chi}=\sup \left\{r \in \mathbf{Z} ; \chi \mid \prod_{j=r}^{\infty} \mathrm{G}^{())} \equiv \equiv 1\right\} \quad$ if $\quad \chi \neq \mathrm{O}_{\hat{\mathrm{G}}}, \quad$ and $\quad \nu_{\mathrm{O}_{\hat{\mathrm{G}}}}=0$.
$\varphi_{X}=\sup _{\mathbf{K}_{r} \leq v_{k}} r$
$\delta_{\chi}=\left|\left\{r \in \mathbf{Z} ; r \geqslant 1,\left.\chi\right|_{\mathbf{x}_{r} \leqslant j<\mathbf{k}_{r+1}} \mathrm{G}^{()} \not \equiv 1\right\}\right|$
let us also define for $j \geqslant 1$ :

$$
\mathrm{X}_{j}=\left\{\chi \in \hat{\mathrm{G}} ; \quad \varphi_{\chi}=j, \quad \delta_{\chi} \leqslant(\log i)^{2}\right\} \subseteq \hat{\mathrm{G}}
$$

and :

$$
\mathrm{X}=\bigcup_{j=1}^{\infty} \mathrm{X}_{j} \subseteq \hat{\mathrm{G}}
$$

and let us observe that using (4.1) we have:
(4.2) $\left|\mathrm{X}_{j}\right| \leqslant j^{(\log ))^{2}} p^{\left.\mathbf{N ( K} \mathrm{K}_{j+1}-\mathrm{K}_{j}\right)(\log )^{2}} \leqslant \exp \left\{\mathrm{C}(\log j)^{3}\right\}$.

Let now $\mathcal{G}=\left\{g_{n} \in G\right\}_{n=1}^{\infty}$ be a family that satisfies:

$$
\begin{equation*}
g_{n} \in \mathrm{G}^{(n)} \backslash \tau_{p}\left(\mathrm{G}^{(n)}\right) . \tag{4.3}
\end{equation*}
$$

And let us define:
and

$$
\begin{gathered}
\lambda[\mathrm{G} ; \mathfrak{G}, \mathscr{K}]=\lambda=\bigotimes_{j=1}^{\infty} \lambda_{j} \\
\lambda^{\prime}[\mathrm{G} ; \mathcal{G}, \mathscr{F}]=\lambda^{\prime}=\bigotimes_{j=1}^{\infty} \lambda_{j}^{\prime} ;
\end{gathered}
$$

the $\Lambda$ and $\Lambda^{\prime}$ measures associated to $\mathcal{G}$ and $\Re=\left\{\mathrm{K}_{j}\right\}_{j=1}^{\infty}$, and let us observe that when $p \neq 2$ we have the following two facts:
a) If $x \in s\left(\lambda_{n}\right)$ then we have $\lambda_{n}(\{x\})=\frac{1}{2\left(\mathrm{~K}_{n+1}-\mathrm{K}_{n}\right)}$.
b) $s\left(\lambda_{n}\right)=-s\left(\lambda_{n}\right)$ and by (4.3) $\mathrm{G} p\left[s\left(\lambda_{n}\right)\right]=\prod_{\mathbf{K}_{n} \leqslant j<\mathbf{K}_{n+1}} \mathrm{G}^{(j)}$ for $\chi \in \hat{\mathrm{G}}$ if $\left.\chi\right|_{\mathbf{k}_{n} \leqslant j<\mathbf{k}_{n+1}} \mathrm{G}^{(j)} \equiv \equiv 1$, then $\chi$ cannot be constant on $s\left(\lambda_{n}\right)$ and so there exist two points $x_{1}, x_{2} \in s\left(\lambda_{n}\right)$ with

$$
\chi\left(x_{j}\right)=\exp \left(\frac{2 \pi r_{j} i}{p^{\mathbb{N}}}\right) j=1,2 \quad \text { and } \quad r_{1} \equiv \equiv r_{2}\left(\bmod p^{\mathbb{N}}\right) .
$$

From observations $a$ ) and $b$ ) using (4.1) we deduce at once:

$$
\begin{align*}
\left.\chi\right|_{\mathbf{K}_{n} \leqslant j<\mathrm{K}_{n+1}} \mathrm{G}^{(J)} \equiv 1 \Rightarrow\left|\hat{\lambda}_{n}(\chi)\right| \leqslant 1 & -\frac{\beta}{\mathrm{K}_{n+1}-\mathrm{K}_{n}}  \tag{4.4}\\
& \leqslant 1-\frac{\beta}{\log \varphi_{\chi}+\mathrm{C}_{1}}
\end{align*}
$$

for some $\beta=\beta(p, \mathrm{~N})>0$ and $\mathrm{C}_{1}$ constants (independent of $n$ and $\chi$ ).

Then from (4.4) and remarks (1.vii) we see that if $p \neq 2$ :

$$
\begin{equation*}
|\hat{\lambda}(\chi)| \leqslant\left(1-\frac{\beta}{\log \varphi_{x}+C_{1}}\right)^{\delta /} . \tag{4.5}
\end{equation*}
$$

Also we have analogously for $p=2$

$$
\left.\chi\right|_{\mathbf{K}_{n} \leqslant j<\mathbf{K}_{n+1}} \mathrm{G}^{(j)} \equiv 1 \Longrightarrow\left|\hat{\lambda}^{\prime}(\chi)\right| \leqslant 1-\frac{\gamma}{\mathrm{K}_{n+1}-\mathrm{K}_{n}+1}
$$

for some $\gamma=\gamma(\mathrm{N})>0$.

$$
\leqslant 1-\frac{\gamma}{\log \varphi_{\chi}+C_{2}}
$$

And from that it follows just as above that for $p=2$

$$
\begin{equation*}
\left|\hat{\lambda}^{\prime}(\chi)\right| \leqslant\left(1-\frac{\gamma}{\log \varphi_{\chi}+C_{2}}\right)^{\delta /} . \tag{4.6}
\end{equation*}
$$

Let us now define the series of subgroups of G :

$$
\begin{gathered}
\Sigma=\Sigma[\mathrm{G}, \nVdash], \\
\mathrm{G}=\mathrm{G}_{0} \supseteq \mathrm{G}_{1} \supseteq \mathrm{G}_{2} \supseteq \cdots \supseteq \mathrm{G}_{n} \supseteq \cdots \supseteq \overbrace{n=1}^{\infty} \mathrm{G}_{n}=\left\{\mathrm{O}_{\mathrm{G}}\right\}
\end{gathered}
$$

by

$$
\mathrm{G}_{n}=\prod_{j \geqslant \mathrm{~K}_{n}} \mathrm{G}^{(j)} \quad \text { for } \quad \text { all } \quad n \geqslant 1 ;
$$

and let us consider $\mu=\mu_{\omega}$ and $\mu^{\prime}=\mu_{\omega^{\prime}}^{\prime}$ the $\Omega$ and $\Omega^{\prime}$ random measures associated to the series.

Now using remark (1.iii) we obtain the following estimates

$$
\mathbf{E}|\hat{\mu}(\chi)|=\prod_{j=1}^{\infty} \mathbf{E}\left|\hat{\mu}_{j}(\chi)\right|=\prod_{j \leqslant \varphi_{k}} \mathbf{E}\left|\hat{\mu}_{j}(\chi)\right|
$$

with the usual interpretation of the empty product as 1.
Now since for $j \leqslant \varphi$, we have $\chi \mid \mathrm{G}_{j} \equiv \equiv 1$, we see, using remark (1.iv), that for $p \neq 2$ :

$$
j \leqslant \varphi_{\mu} \Longrightarrow \mathbf{E}|\hat{\mu}(\gamma)| \leqslant \sup _{1 \leqslant n \leqslant \mathrm{~s}}\left\{\sigma\left(1, p^{n}\right)\right\}=\delta<1 ;
$$

so finally we conclude:

$$
\begin{equation*}
\mathbf{E}|\hat{\mu}(\gamma)| \leqslant \delta^{\Phi \gamma} . \tag{4.7}
\end{equation*}
$$

Analogously for $p=2$ we see, using remark (1.iii) that

$$
\mathbf{E}\left|\hat{\mu}^{\prime}(\chi)\right|=\prod_{j=1}^{\infty} \mathbf{E}\left|\hat{\mu}_{j}^{\prime}(\chi)\right|=\prod_{j \leqslant \Phi_{,}} \mathbf{E}\left|\hat{\mu}_{j}^{\prime}(\chi)\right| ;
$$

and just as above using (1.v) we see that for $p=2$ :

$$
j \leqslant \varphi_{x} \Longrightarrow \mathrm{E}\left|\hat{\mu}_{j}^{\prime}(\gamma)\right| \cdot \leqslant \alpha=\alpha(\mathrm{N})<1
$$

so finally:

$$
\begin{equation*}
\mathbf{E}\left|\hat{\mu}^{\prime}(\chi)\right| \leqslant \alpha^{\varphi^{\varphi}} . \tag{4.8}
\end{equation*}
$$

Now using (4.2) and (4.7) we see that

$$
\begin{aligned}
\sum_{\chi \in \mathbf{X}} \mathbf{E}|\hat{\mu}(\chi)|= & \sum_{\mathbf{M}} \sum_{\chi \in \mathbf{X}_{\mathbf{M}}} \mathbf{E}|\hat{\mu}(\chi)| \leqslant \sum_{\mathbf{M}}\left|X_{\mathbf{M}}\right| \sup _{\chi \in \mathbf{X}_{\mathbf{M}}}(E|\hat{\mu}(\chi)|) \\
& \leqslant \sum_{\mathbf{M}} \exp \left\{\mathbb{C}(\log \mathbf{M})^{3}+(\log \delta) \mathbf{M}\right\}<+\infty
\end{aligned}
$$

and thus the conditions of Lemma 1.1 are satisfied and we conclude that for $p \neq 2$ :

$$
\begin{equation*}
\hat{\mu}(\chi) \xrightarrow[\chi \in x ; x \rightarrow \infty]{ } 0 \quad \text { almost surely. } \tag{4.9}
\end{equation*}
$$

In an entirely analogously fashion we see that for $p=2$ :

$$
\begin{equation*}
\hat{\mu}^{\prime}(\chi) \xrightarrow[\chi \in x_{;} \chi \rightarrow \infty]{ } 0 \quad \text { almost surely } \tag{4.10}
\end{equation*}
$$

Let us now observe that for all $\omega \in \Omega$ ( $\omega^{\prime} \in \Omega^{\prime}$ respectively) the sequences of measures $\left\{\lambda_{n}\right\}_{n=1}^{\infty}$ and $\left\{\mu_{n, \omega}\right\}_{n=1}^{\infty}$

$$
\left(\left\{\lambda_{n}^{\prime}\right\}_{n=1}^{\infty} \quad \text { and } \quad\left\{\mu_{n, \omega^{\prime}}^{\prime}\right\}_{n=1}^{\infty} \quad \text { respectively }\right)
$$

satisfy the conditions of Lemma 1.4 if we take $\mathscr{L}=\Pi$. So we deduce that for all $\omega \in \Omega$ and all $\omega^{\prime} \in \Omega^{\prime}$ and all $m \in \mathbf{Z}$ with $\tau_{m}(\mathrm{G}) \neq \mathrm{O}_{\mathrm{G}}$ we have:

$$
\text { (4.11) } \begin{aligned}
& h_{\mathrm{G}}\left[g \in \mathrm{G} ; m g \in \mathrm{G} p\left(s\left(\lambda * \mu_{\omega}\right)\right)\right] \\
&=h_{\mathrm{G}}\left[g \in \mathrm{G} ; \mathrm{mg} \in \mathrm{G} p\left(s\left(\lambda^{\prime} * \mu_{\omega^{\prime}}^{\prime}\right)\right)\right]=0 .
\end{aligned}
$$

Thus finaly taking (4.11) into account and remarks (1.ii) and (1.vi) we see that Theorem $\Pi_{2}$ will follow if we prove:
(P) (i) For $p \neq 2 \quad$ almost surely $\quad \lambda * \mu_{\omega} \in \mathrm{M}_{0}(\mathrm{G})$
(ii) For $p=2 \quad$ almost surely $\quad \lambda^{\prime} * \mu_{\omega^{\prime}}^{\prime} \in \mathrm{M}_{0}$ (G)
more explicitly :
$\mathrm{P}(\mathrm{i}) \Longrightarrow \lambda * \mu$ is an $\mathrm{S}^{*}$-measure of G almost surely when $p \neq 2$.
$\mathrm{P}(\mathrm{ii}) \Longrightarrow \lambda^{\prime} * \mu^{\prime}$ is an $\mathrm{S}^{*}$-measure of G almost surely when $p=2$.
To prove $P(\mathrm{i})$ it suffices, taking (4.9) into account, to prove that, if $\omega \in \Omega$ is such that $\hat{\mu}(\chi) \xrightarrow[\chi \in x_{i} ; \chi \rightarrow \infty]{ } 0$ then:

$$
\begin{equation*}
\hat{\lambda}(\chi) \hat{\mu}_{\omega}(\chi) \underset{\chi \rightarrow \infty}{\longrightarrow} 0 . \tag{4.12}
\end{equation*}
$$

This we do; towards that let for $j \geqslant 1$;

$$
\mathrm{X}_{j} \subseteq \mathrm{~T}_{j}=\left\{\chi \in \hat{\mathrm{G}} ; \quad \varphi_{\chi}=j\right\} \subset \hat{\mathrm{G}} ; \quad j_{1} \neq j_{2} \Longrightarrow \mathrm{~T}_{j_{\mathbf{1}}} \cap \mathrm{T}_{j_{\mathbf{2}}}=\varnothing
$$

then :

$$
\begin{gather*}
\left|\mathrm{T}_{j}\right|<+\infty, \quad \bigcup_{j=1}^{\infty} \mathrm{T}_{j} \cup \mathrm{O}_{\hat{\mathrm{G}}}=\hat{\mathrm{G}} ;  \tag{4.13}\\
\chi \in \mathrm{T}_{j} \backslash \mathrm{X}_{j} \Longrightarrow \delta_{\chi}>(\log j)^{2} .
\end{gather*}
$$

From that using remarks (1.ii) and (1.vi) and (4.5) and the choice of $\mu_{\omega}$ we see that:
and :

$$
s_{j}=\sup _{\chi \in \mathbf{X}_{j}}\left|\hat{\mu}_{\omega}(\chi) \hat{\lambda}(\chi)\right| \leqslant \sup _{\chi \in \mathbf{X}_{j}}\left|\hat{\mu}_{\omega}(\chi)\right| \underset{j>\infty}{ } 0
$$

$\sigma_{j}=\sup _{\chi \in \mathbb{T}_{j} \chi_{j}}\left|\hat{\mu}_{\omega}(\chi) \hat{\lambda}(\chi)\right| \leqslant \sup _{\chi \in \mathbb{T}_{j} \wedge x_{j}}|\hat{\lambda}(\chi)|$

$$
\leqslant\left(1-\frac{\beta}{\log j+\mathrm{C}_{1}}\right)^{(\log )^{z}} \underset{j \neq \infty}{ } 0
$$

so :

$$
\sup _{\chi \in \mathbb{T}_{j}}\left|\hat{\mu}_{\omega}(\chi) \hat{\lambda}(\chi)\right| \leqslant \max \left\{s_{j} ; \sigma_{j}\right\} \underset{j \neq \infty}{ } 0
$$

and that together with (4.13) implies (4.12).
The proof of $\mathrm{P}(\mathrm{ii})$ follows in an entirely analogous line when we use (4.10) and (4.6).
5. The case $\mathrm{G}=\prod_{j=1}^{\infty} \mathrm{Z}\left(p^{j}\right)$ for some fixed prime $\boldsymbol{p}$.

Let us in this paragraph readopt some of the notations of §3; in particular let:
$\mathrm{K}_{j}=\left[j(\log j)^{1 / 4}\right]$ be the integral part of $j(\log j)^{1 / 4}$ for $j \geqslant 1$.

Let us also fix $\left\{\mathrm{H}_{j}\right\}_{j=1}^{\infty}$ a sequence of integers such that:
(5.1) $\quad \mathrm{H}_{1}=1, \quad \mathrm{H}_{j} \uparrow \infty, \quad \frac{\mathrm{H}_{j+i}}{r=j} \geqslant(j+1)^{2}$ for $j \geqslant 1$.

$$
\sum_{r=1} H_{r}
$$

Let us also introduce for all $n \geqslant 1$;

$$
\begin{array}{llll}
\alpha(n)=\inf \{j \in \mathbf{Z} ; & j \geqslant 1, & \left.\mathrm{H}_{j} \geqslant \mathrm{~K}_{n}\right\} & \alpha(n) \uparrow \infty \\
\beta(n)=\sup \{j \in \mathbf{Z} ; & j \geqslant 1, & \left.\mathrm{~K}_{j} \leqslant n\right\} & \beta(n) \uparrow \infty
\end{array}
$$

and we observe that:

$$
\begin{array}{r}
{[n \in \mathbf{Z} ; n \geqslant 1, \alpha(n) \leqslant m]=\left[n \in \mathbf{Z}, n \geqslant 1, \mathrm{~K}_{n} \leqslant \mathbf{H}_{m}\right]}  \tag{5.2}\\
\Longrightarrow \sup _{\alpha(n) \leqslant m} n=\beta\left(\mathbf{H}_{m}\right)
\end{array}
$$

and that:

$$
\begin{equation*}
\beta(n)=0\left(\frac{n}{(\log n)^{1 / 8}}\right) \quad \text { as } \quad n \rightarrow \infty \tag{5.3}
\end{equation*}
$$

we can then state:
Theorem $\mathrm{II}_{3} .-$ If $\mathrm{G}=\prod_{j=1}^{\infty} \mathrm{G}_{j}$ with $\mathrm{G}_{j}=\mathbf{Z}\left(p^{\mathrm{H}_{i}}\right) \quad(j \geqslant 1)$ and $\left\{\mathrm{H}_{j}\right\}{ }_{j=1}^{\infty}$ satisfying (5.1); then G has $\mathrm{S}^{*}$-measures.

Proof. - Observe that $\hat{\mathrm{G}}=\sum_{j=1}^{\infty} \hat{\mathrm{G}}_{j}$ where $\hat{\mathrm{G}}_{j} \cong \mathbf{Z}\left(p^{\mathrm{H}_{j}}\right)$ and that the canonical injections $\hat{\mathrm{G}}_{j} \rightarrow \mathbf{Z}\left(p^{\infty}\right)(j \geqslant 1)$ induce a projection:

$$
q: \hat{\mathrm{G}} \rightarrow \mathbf{Z}\left(p^{\infty}\right)
$$

which by polarity induces a canonical injection :

$$
q^{0}=i: \mathbf{U}(p)=\left(\mathbf{Z}\left(p^{\infty}\right)^{\wedge} \rightarrow \mathbf{G}\right.
$$

Let now $\nu={\underset{j}{*}=1}_{\infty}^{\nu_{j}}$ be an S-measure of $\mathbf{U}(p)$ as constructed in $\S 3$, and using the injection $i$ let us identify $\nu_{j}(j \geqslant 1)$ and $\nu$ with elementary $M(G)$, going back then to $\S 3$, we see that for that identification, for all $n \geqslant 1$

$$
\begin{equation*}
s\left(v_{n}\right) \subseteq i\left\{\left(\mathbf{Z}\left(p^{\mathbf{K}_{n}}\right)\right)^{\circ}\right\} \subseteq \prod_{j \geqslant \alpha(n)} \mathrm{G}_{j} ; \tag{5.4}
\end{equation*}
$$

and

$$
\left|s\left(\nu_{n}\right)\right|=2
$$

Let us also fix once and for all:

$$
\left\{\theta_{j} \in \mathrm{M}^{+}\left(\mathrm{G}_{j}\right)\right\}_{j=1}^{\infty}
$$

satisfying the following conditions: $\theta_{1}=\delta_{0}$ and for $j \geqslant 2$ we have
$\left\|\theta_{j}\right\|=1 ; \quad\left|\mathrm{s}\left(\theta_{j}\right)\right|=p^{\mathbf{H}_{j-1}} ; \quad 0 \equiv \equiv \equiv \chi \in \mathbf{Z}\left(p^{\mathbf{H}_{j-1}}\right) \subset \hat{\mathrm{G}}_{j} \Longrightarrow \hat{\theta}_{j}(\chi)=0$
such a sequence of measures exists always, e.g. consider $\left[\mathrm{G}_{j}: \mathbf{Z}\left(p^{\mathbf{H}_{j}-\mathbf{H}_{j-1}}\right)\right]$ a section of $\mathrm{G}_{j} \rightarrow \mathbf{Z}\left(p^{\mathbf{H}_{j-1}}\right)$ in $\mathrm{G}_{j}$ and give equal masses to all of its points.

Using that sequence let us define $\theta=\bigotimes_{j=1}^{\infty} \theta_{j} \in M(G)$ and let us also define $\varphi=\nu * \theta$ we have of course $\varphi \geqslant 0$ and $\|\varphi\|=1$ and we shall prove that $\varphi$ is an $S^{*}$-measure of $G$.

It is trivial to see that $\varphi \in M_{0}(G)$. Indeed by the definition of $\theta$ and the fact that for all $\chi \in \hat{G} \hat{\theta}(\chi)=\prod_{j=1}^{\infty} \hat{\theta}_{j}(\chi)$, we see that if $\left\{\chi_{\alpha} \in \hat{\mathrm{G}}\right\}_{\alpha \in \mathrm{A}}$ is a net in $\hat{\mathrm{G}}$ such that $\chi_{\alpha} \in \operatorname{supp} \hat{\varphi} \subset \operatorname{supp} \hat{\theta}$ for all $\alpha \in \mathrm{A}$, and $\chi_{\alpha} \underset{\alpha \in A}{ } \infty$ we have $q\left(\chi_{\alpha}\right) \overrightarrow{\alpha \in A} \infty$ in $\mathbf{Z}\left(p^{\infty}\right)$; thus $\hat{\nu}\left(\chi_{\alpha}\right) \underset{\alpha \in \mathbf{A}}{ } 0 \Longrightarrow \hat{\phi}\left(\chi_{\alpha}\right) \underset{\alpha \in \mathbf{A}}{ } 0$.

We proceed to prove that the condition on the support of $\varphi$ is satisfied. Towards that using the argument developed the end of the proof of Lemma 1.4 we see that it suffices to prove that for all $\zeta \in Z \zeta \geqslant 0$ we have :

$$
\begin{equation*}
h_{\tau_{p^{z}(G)}}\left[\mathrm{G} p(s(\varphi)) \cap \tau_{p^{z}}(\mathrm{G})\right]=0 . \tag{5.5}
\end{equation*}
$$

To show that, let us observe that for all $N \in \mathbf{Z}, \mathrm{~N} \geqslant 1$ we have, using (5.4) and (5.2) :

$$
s(v) \subseteq \sum_{j=1}^{\beta\left(\mathbf{H}_{\mathbb{N}}\right)} s\left(\nu_{j}\right)+\prod_{j>\mathbf{N}} \mathrm{G}_{j}
$$

and thus :

$$
s(\varphi) \subseteq \sum_{j=1}^{\beta\left(\mathrm{H}_{\mathrm{N}}\right)} s\left(\nu_{j}\right)+\sum_{j=1}^{\mathbf{N}} s\left(\theta_{j}\right)+\prod_{j>\mathrm{N}} \mathrm{G}_{j} .
$$

Therefore using the arguments of the proof of Lemma 1.4 and in particular (1.6) and what follows: we have for all
fixed $R \in Z$ and $N>|\zeta|$

$$
\begin{aligned}
& h_{\tau_{p} ;(\mathrm{G})}\left[(\mathrm{R} s(\varphi)-\mathrm{R} s(\varphi)) \cap \tau_{p^{\prime}( }(\mathrm{G})\right] \leqslant 2^{2 \mathbf{R} \beta\left(\mathbf{H}_{\mathrm{N}}\right)} p^{2 \mathbf{R} \sum_{j=1}^{\mathrm{N}-\mathbf{1}} \mathbf{H}_{j}} p^{-\left(\sum_{j=1}^{\mathrm{N}} \mathbf{H}_{j}-\zeta \mathbf{N}\right)} \\
& =\exp \left(-\mathrm{C}_{1} \mathrm{H}_{\mathrm{N}}+\mathrm{C}_{2} \sum_{j=1}^{\mathrm{N}-1} \mathrm{H}_{j}+\mathrm{C}_{3} \mathrm{~N}+\mathrm{C}_{4} \beta\left(\mathrm{H}_{\mathrm{N}}\right)\right) \underset{n \rightarrow \infty}{\longrightarrow} 0
\end{aligned}
$$

by (5.1) (5.3) ( $\mathrm{C}_{j}>0,1 \leqslant j \leqslant 4$ are constants). This together with the fac that $\mathrm{G} p(s(\varphi))=\bigcup_{\mathrm{R}=1}^{\infty}(\mathrm{R} s(\varphi)-\mathrm{R} s(\varphi))$ prove $(5.5)$
and completes the proof.

## 6. Proof of Theorem $S$ and application.

We start with a lemma on locally compact abelian groups :
Lemma 6.1.-(i) Let G be a compact group and $\mathrm{H} \subset \mathrm{G}$ be a closed subgroup then:
a) If $\mathrm{G} / \mathrm{H}$ has S -measures so has G .
$\beta$ ) If $\mathrm{G} / \mathrm{H}$ has $\mathrm{S}^{*}$-measures and is in addition a group unbounded order $\left(m \neq 0 \Longrightarrow \tau_{m}(\mathrm{G} / \mathrm{H}) \neq \mathrm{O}_{\mathrm{G} / \mathrm{H}}\right)$ then G has $\mathrm{S}^{*}$-measures also.
(ii) If G and H are locally compact groups and if they both have $\mathrm{S}^{*}$-measures (respectively S -measures) then $\mathrm{G} \times \mathrm{H}=\mathrm{K}$ has $\mathrm{S}^{*}$-measures (respectively S -measures).
(iii) If G is a locally compact group and $\Omega \subset \mathrm{G}$ is an open subgroup of G then if $\Omega$ has S -measures so has G .

Proof. - (i) Observe that if $p: \mathrm{G} \rightarrow \mathrm{G} / \mathrm{H}$ is the canonical projection, there exists a canonical injection

$$
\bar{p}: \mathrm{M}(\mathrm{G} / \mathrm{H}) \rightarrow \mathrm{M}(\mathrm{G})
$$

(cf. [1] ch .7) such that :

$$
\begin{align*}
p^{-1}\left(\mathrm{M}_{0}(\mathrm{G} / \mathrm{H})\right) \subset \mathrm{M}_{0}(\mathrm{G}), \bar{p}\left(\mathrm{M}^{+}(\mathrm{G} / \mathrm{H})\right) & \subset \mathrm{M}^{+}(\mathrm{G})  \tag{6.1}\\
s(\bar{p}(\mu)) & =\bar{p}^{-1}(s(\mu))
\end{align*}
$$

From that we see at once that for all $\mu \in M(G / H)$ and $m \in Z$, $m \neq 0$ :

$$
\begin{array}{r}
p[g \in \mathrm{G} ; m g \in \mathrm{G} p\{s(\bar{p}(\mu))\}]  \tag{6.2}\\
=[\dot{\mathrm{g}} \in \mathrm{G} / \mathrm{H} ; m \dot{g} \in \mathrm{G} p(s(\mu))]
\end{array}
$$

putting $m=1$ and $\mu$ an $S$-measure of $G / H$ in (6.2) we see using (6.1) that $\bar{p}(\mu)$ is an $S$-measure of $G$ and that proves $\alpha$.

To prove $\beta$ we let $\mu$ be an $S^{*}$-measure of $G / H$, and $m \neq 0$, $m \in \mathbf{Z}$, then by the hypothesis on $G / H$ we see that

$$
h_{\mathrm{G} / \mathrm{H}}[\dot{g} \in \mathrm{G} / \mathrm{H} ; \quad m \dot{g} \in \mathrm{G} p(s(\mu))]=0
$$

and that, together with (6.1) and (6.2) implies that $\bar{p}(\mu)$ is an $\mathrm{S}^{*}$-measure of G .
(ii) Let $\lambda$ and $\mu$ be $S^{*}$-measures of $G$ and $H$ respectively, then if $\nu=\lambda \otimes \mu \in M(K)$, we have:

$$
\begin{equation*}
0 \neq \nu \in \mathrm{M}_{\mathbf{0}}(\mathrm{K}), \quad \nu \geqslant 0 \tag{6.3}
\end{equation*}
$$

also if $m \in \mathbf{Z}$ is such that $\tau_{m}(\mathrm{~K}) \neq \mathrm{O}_{\mathrm{K}}$, then either $\tau_{m}(\mathrm{G}) \neq \mathrm{O}_{\mathbf{G}}$ or $\tau_{m}(\mathrm{H}) \neq \mathrm{O}_{\mathrm{H}}$ or both; suppose then that $\tau_{m}(\mathrm{G}) \neq \mathrm{O}_{\mathrm{G}}$ then by the hypothesis:

$$
h_{\mathrm{G}}[g \in \mathrm{G} ; \quad m g \in \mathrm{G} p(s(\lambda))]=0
$$

and that implies:

$$
h_{\mathbf{K}}[k \in \mathrm{G} ; \quad m k \in \mathrm{G} p(s(\nu))]=0
$$

which together with (6.3) implies that $\nu$ is an $S^{*}$-measure of $K$.
The result about S-measures follows similarily and is only simpler.
(iii) Is trivial.

Definition 6.1. - (i) We shall call a compact abelian group G a group of type T if $\hat{\mathrm{G}}$ has torsion free elements.
(ii) We shall call a compact abelian group G a group of type $\mathbf{U}$ if $\hat{\mathrm{G}}$ contains a subgroup $\mathrm{B} \subset \hat{\mathrm{G}}, \mathrm{B} \cong \mathbf{Z}\left(p^{\infty}\right)$ for some prime $p$.
(iii) We shall call a compact abelian group G a group of type $\Pi$ if $\hat{\mathrm{G}}$ contains a subgroup $\Sigma \subset \hat{\mathrm{G}}$ such that $\Sigma \cong \sum_{n=1}^{\infty} \mathbf{Z}\left(p_{n}^{\mathbb{N}_{n}}\right)$, where $p_{n}$ are primes and $\mathrm{N}_{n} \in \mathbf{Z}, \mathrm{~N}_{n} \geqslant 1(n \geqslant 1)$, and where $p_{n}^{\mathbf{N}_{n}} \xrightarrow[n \rightarrow \infty]{ } \infty$.

Observe that the above classification is not identical with the one given in [8] §5. With our classification we can obtain :

Corollary 6.1. - (i) Groups of type T and $\mathbf{U}$ have $\mathrm{S}^{*}$-measures.
(ii) Groups of type $\Pi$ have $\mathrm{S}^{*}$-measures.

Proof. - (i) It follows from a theorem by Salem [7], from theorem U , and from Lemma 0.1 and Lemma 0.2 , that $\mathbf{T}$, the one dimensional torus, and $\mathbf{U}(p)$, the additive group of $p$-adic integers, for any prime $p$, have $\mathrm{S}^{*}$-measures. Our result follows from that, Lemma 6.1 (i) $\beta$, and the simple observation that if $\mathrm{B} \subset \hat{\mathrm{G}}$ and $\mathrm{B} \cong \mathbf{Z}$ or $\mathbf{Z}\left(p^{\infty}\right)$ then $\mathrm{G} / \mathrm{B}^{0} \cong \mathbf{T}$ or $\mathbf{U}(p)$.
(ii) Let $G$ be a group of type $\Pi$ and let $\hat{G} \supseteq \Sigma \cong \sum_{n=1}^{\infty} \mathbf{Z}\left(p_{n}^{\mathbb{N}_{n}}\right)$ with $p_{n}^{\mathbb{N}_{n}} \xrightarrow[n \rightarrow \infty]{ } \infty$ as in the definition. We distinguish two mutually exclusive cases.
a) $\sup p_{n}<+\infty$ : then there exists $\Sigma_{1} \subseteq \Sigma \subseteq \hat{G}$ such that $\Sigma_{1} \cong \sum_{n=1}^{n} \mathbf{Z}\left(p^{\mathrm{N}_{n}}\right)$ with $\mathrm{N}_{n} \xrightarrow[n \rightarrow \infty]{ } \infty$ and some fixed prime $p$. Then there exists $\Sigma_{2} \subseteq \Sigma_{1}$ with $\Sigma_{2} \cong \sum_{j=1}^{\infty} \mathbf{Z}\left(p^{\mathrm{H}_{j}}\right)$ where $\mathrm{H}_{j}$ satisfy (5.1) : then $\mathrm{G} / \Sigma_{2}^{0} \cong \prod_{j=1}^{\infty} \mathbf{Z}\left(p^{\mathrm{H}_{j}}\right)$, and thus, a simple use of Theorem $\Pi_{3}$ and Lemma 6.1 (i) $\beta$. proves the result.
b) $\sup _{n} p_{n}=+\infty$ : then just as above we see that

$$
\Sigma_{1} \subseteq \Sigma \subseteq \hat{\mathrm{G}}
$$

where $\Sigma_{1} \cong \sum_{n=1}^{\infty} \mathbf{Z}\left(p_{n}\right)$ with $p_{n} \xrightarrow[n \rightarrow \infty]{ } \infty$, and by remark (2.i) we may assume that $\left\{p_{n}\right\}_{n=1}^{\infty}$ is a very rapidly increasing sequence of prismes. Then $\mathrm{G} / \Sigma_{1}^{0} \cong \prod_{n=1} \mathbf{Z}\left(p_{n}\right)$, and thus G has $\mathrm{S}^{*}$-measures by Theorem $\Pi_{1}$ and Lemma 6.1 (i) $\beta$.

We next prove:
Lemma 6.2. - If a compact abelian group G is neither a group of type T , type $\mathbf{U}$ or type $\Pi$, then it is a group of bounded order, and thus $([3], 8) \mathrm{G} \cong \prod_{\alpha \in \mathrm{A}} \mathbf{Z}\left(p_{\alpha}^{n_{\alpha}}\right)$, where for all $\alpha \in \mathrm{A} p_{\alpha}$ is a prime number and $n_{\alpha}$ is a positive integer such that

$$
\sup _{\alpha \in \mathrm{A}} p_{\alpha}^{n_{\alpha}}<+\infty .
$$

Proof. - Using duality we see that to prove the Lemma it suffices to prove that:
"If $\mathrm{A}(=\hat{\mathrm{G}})$ is a discrete abelian group such that: $(\alpha) \mathrm{A}$ is a torsion group.
$(\beta) \mathrm{A}$ is not of bounded order.
$(\gamma) \mathrm{A}$ is a reduced group. $\longleftrightarrow \mathrm{A}$ contains no divisible subgroups. $\longleftrightarrow \mathrm{A}$ contains no subgroups isimorphic to any $\mathbf{Z}\left(p^{\infty}\right)$ for any $p$ prime number (use ( $\alpha$ )).

Then A contains a subgroup $\mathcal{E c} \mathrm{A}$ such that

$$
\Sigma \cong \sum_{n=1}^{\infty} \mathbf{Z}\left(p_{n}^{\mathbb{N}_{n}}\right)
$$

for $\left\{p_{n}^{\mathrm{N}_{n}}\right\}_{n=1}^{\infty}$ a sequence of powers of primes with $p_{n}^{\mathbf{V}_{n}} \xrightarrow[n \rightarrow \infty]{ } \infty$.)
To prove the above we can make on A the extra assumption : ( $\delta$ ) «A is a $p$-primary group for some prime $p$.» Indeed, anyway $\mathrm{A}=\bigoplus_{p} \mathrm{~A}_{p}$ is the direct sum of its primary components, if the number of those components is infinite the conclusion above follows at once, otherwise we see that one of those components must satisfy ( $\beta$ ) (and of course also ( $\alpha$ ) and ( $\gamma$ )), and we can argue on that component.

Now to prove the above statement it suffices to show that, for every group A satisfying conditions ( $\alpha$ )-( $\delta$ ), and for every $\mathrm{N} \in \mathbf{Z}, \mathrm{N} \geqslant 1$, there exists a direct decomposition $\mathrm{A}=\mathrm{B} \oplus \mathrm{C}$ where $\tau_{p^{x}}(B) \neq O_{B}$ and $\tau_{p^{x}}(C) \neq O_{C}$. For then, it would follow that either $B$ or $C$ or both satisfy conditions ( $\alpha$ ) - ( $\delta$ ), and thus iterating the decomposition with increasing N , we would obtain :

$$
\mathrm{A} \supseteq \mathrm{D} \cong \mathrm{~B}_{1} \oplus \mathrm{~B}_{2} \oplus \cdots \oplus \mathrm{~B}_{n} \oplus \cdots
$$

such that $\tau_{p^{n}}\left(\mathrm{~B}_{n}\right) \neq \mathrm{O}_{\mathrm{B}_{n}}(n \geqslant 1)$, and that clearly implies our assertion.

Thus suppose that for some A satisfying conditions ( $\alpha$ ) - ( $\delta$ ), and some positive integer N , such a decomposition is impossible. From that contradictory hypothesis it follows that in all direct decompositions of $\mathrm{A}=\mathrm{B} \oplus \mathrm{C}$ we always have either

$$
\tau_{p^{x}}(\mathrm{~B})=\mathrm{O}_{\mathrm{B}} \quad \text { or } \quad \tau_{p^{x}}(\mathrm{C})=\mathrm{O}_{\mathrm{C}}
$$

Now let $\left\{A=B_{\theta} \oplus C_{\theta}\right\}_{\theta \in \Theta}$ be a family of direct decompositions where $\Theta$ is a simply ordered set such that

$$
\theta_{1} \leqslant \theta_{2} \Longrightarrow B_{0_{1}} \subseteq B_{\theta_{2}}
$$

and such that $\tau_{p^{n}}\left(B_{\theta}\right)=O_{A} ; \theta \in \Theta$. Then we claim that $B=\bigcup_{\theta \in \Theta} B_{\theta}$ is a direct component of $A$, of order $\leqslant p^{N}$. Indeed $\tau_{p^{x}}(B)=O_{A}$ trivially, further $B$ is a serving (pure) subgroup of A (indeed $x \in \mathrm{~B}$ and $n y=x$ some $y \in \mathrm{~A}$ and $n \in \mathrm{Z} \Longrightarrow x \in \mathrm{~B}_{\theta}$ some $\theta \in \Theta$ and $y=b_{\theta}+c_{\theta}$ with $b_{\theta} \in \mathrm{B}_{\theta} c_{\theta} \in \mathrm{C}_{\theta} \Longrightarrow n b_{\theta}=x$ ), so our assertion is a consequence of a well-known theorem in abelian group theory ([3] 8-Th. 7].

From the above it follows that the direct summands of A or order $\leqslant p^{\mathrm{N}}$ have maximal elements. Let K be such a maximal element and let $\mathrm{A}=\mathrm{K} \oplus \mathrm{L}$. Now L satisfies conditions ( $\alpha$ ) - ( $\delta$ ) and thus it is a decomposable group ([3] 9 Th. 10) $\mathrm{L}=\mathrm{L}_{1} \oplus \mathrm{~L}_{2}, \mathrm{~L}_{1} \neq 0, \mathrm{~L}_{2} \neq 0$ and thus by our contradictory hypothesis either $\tau_{p^{*}}\left(\mathrm{~L}_{1}\right)=0$ or $\tau_{p^{x}}\left(\mathrm{~L}_{2}\right)=0$ and in either case we contradict the maximality of $K$.

We now prove:
Lemma 6.3. - (i) If G is a metrisable compact abelian group then it has $\mathrm{S}^{*}$-measures.
(ii) If G is any compact abelian group then it has S -measures.

Proof. - Taking corrollary 6.1 and Lemma 6.2 into account, it suffices to prove our Lemma making, in both (i) and (ii), the extra assumption that $G$ is a group of bounded order, then :
(i) $\mathrm{G}=\mathrm{G}_{1} \oplus \mathrm{G}_{2} \oplus \ldots \oplus \mathrm{G}_{\mathrm{R}}$ for some $\mathrm{R} \geqslant 1$ and where $\mathrm{G}_{j} \cong \prod_{n=1}^{\infty} \mathrm{G}_{n}^{(j)}$ with $\mathrm{G}_{n}^{(j)} \cong \mathbf{Z}\left(p_{j}^{\mathrm{N}_{j}}\right)$ for $p_{j}$ prime numbers and $\mathrm{N}_{j}$ positive integers $(1 \leqslant j \leqslant \mathbf{R})$. Our result then follows from Theorem $\Pi_{2}$ and Lemma 6.1 (ii).
(ii) G contains a closed subgroup $\mathrm{H} \subset \mathrm{G}$ such that $\mathrm{G} / \mathrm{H} \cong \prod_{n=1}^{\infty} \mathrm{G}_{n}$ where $\mathrm{G}_{n} \cong \mathrm{Z}(p)$ for some fixed prime $p$ and then the result follows from Theorem $\Pi_{2}$ and Lemma 6.1.i. $\alpha$.

We shall now use the following classical structure theorem (e.g. Cf. [6] 2-4).
( $\Sigma$ ) «Every locally compact abelian group $G$ contains $\Omega \subset G$ an open subgroup such that $\Omega \cong \mathbf{R}^{n} \times K$ for some $n \in \mathbf{Z}, n \geqslant 0$; and K a compact group. "

Now using Salem's result [7] which asserts that $\mathbf{R}$ has S-measures, using also Lemma 6.3(i), Lemma 6.1(ii) and Lemmas 0.1 and Lemma 0.2 our structure theorem ( $\Sigma$ ) above we see that we have:

Corollary 6.2. - Every metrisable non discrete locally compact abelian group, contains a countable at infinity open subgroup $\Omega$ which has $\mathrm{S}^{*}$-measures.

Proof of theorem S. - Using again Lemma 6.3 (ii) the result of Salem [7] and Lemma 6.1 (ii) we see that every group of the from $\mathbf{R}^{n} \times \mathrm{K}$ where K is a compact abelian group, has S-measures provided that either $n \geqslant 1$ or $|K| \geqslant \boldsymbol{N}_{0}$. Theorem $S$ then follows from that, our structure theorem ( $\Sigma$ ) above, and Lemma 6.1 (iii).

We now proceed to give an application of theorem S . Towards that we start by describing a particular case a classical decomposition of M(G) due to Raicov (Cf. [2] § 2).

For $S \subset G$ any compact subset of the locally compact abelian group G let:

$$
\mathfrak{R}(\mathrm{S})=\{g+m \mathrm{~S}-n \mathrm{~S} ; \quad g \in \mathrm{G}, \quad m \geqslant 0, \quad n \geqslant 0\}
$$

and let:

$$
\begin{gathered}
\mathrm{I}(\mathrm{~S})=\{m \in \mathrm{M}(\mathrm{G}) ; \quad \forall \mathrm{R} \in \mathscr{R}(\mathrm{~S}), \quad \mathrm{R} \text { is an } m \text {-null set }\} \\
\mathrm{R}(\mathrm{~S})=\left\{m \in \mathrm{M}(\mathrm{G}) ; \exists\left\{\mathrm{R}_{j} \in \mathscr{R}(\mathrm{~S})\right\}{ }_{j=1}^{\infty} \text { s.t. } \mathrm{G} \backslash \bigcup_{j} \mathrm{R}_{j} \text { is } m \text {-null }\right\} .
\end{gathered}
$$

Then it can be proved [2] that $x \in \mathrm{I}(\mathrm{S})$ and $y \in \mathrm{R}(\mathrm{S}) \Longrightarrow x \perp y$ (are mutually singular) and $\mathrm{I}(\mathrm{S}) \triangleleft \mathrm{M}(\mathrm{G})$ is an ideal, while $R(S)$ is a subalgebra, and we have the decomposition

$$
\mathrm{M}(\mathrm{G})=\mathrm{I}(\mathrm{~S}) \oplus \mathrm{R}(\mathrm{~S})
$$

Let us also define:

$$
\rho_{s}: \mathrm{M}(\mathrm{G}) \rightarrow \mathbf{C} \text { by } \rho_{s}(m)=\int d r \text { where } m=i+r ; i \in \mathrm{I}(\mathrm{~S})
$$

and $r \in \mathrm{R}(\mathrm{S})$ is the orthogonal (unique) decomposition of $m$. It is then easy to see that $\rho_{s}$ is a complex homomorphism i.e. $p_{s} \in \operatorname{mr}(\mathrm{M}(\mathrm{G}))$ [2] the maximal ideal space of $\mathrm{M}(\mathrm{G})$. Also it is easy to verify that for all $m \in M(G)$ we have :

$$
\rho_{s}(\tilde{m})=\overline{\rho_{s}(m)}
$$

in other words that $\rho_{s}$ is a symmetric ideal.
Let us then apply that decomposition starting from $\mathrm{S}=s(\mu)$, for $\mu$ an $S$-measure of $G$, normalised by $\|\mu\|=1$. We verify then at once that $L_{1}(\mathrm{G}) \subseteq \mathrm{I}(\mathrm{S})$, so that $\rho_{s}\left(\mathrm{~L}_{1}(\mathrm{G})\right)=0$ i.e. $\rho_{s} \ddagger \hat{\mathrm{G}}$ for the canonical identification of $\hat{G}$ into a subset $\hat{G} \subset \mathfrak{m}(M(G))$. What is more to the point $p_{s} \oplus(\overline{\hat{G}})$, the topological closure (for the Gelfand topology) of $\hat{G}$ in $\operatorname{mr}(M(G))$, for we have: $\tau \in(\overline{\hat{G}}) \backslash \hat{\mathrm{G}} \Longrightarrow \hat{\mu}(\tau)=0$, while we have $\hat{\mu}\left(\rho_{s}\right)=p_{s}(\mu)=1$.

So we have proved.
Application. - If G is a non discrete locally compact abelian group then there exists $\sigma$ a symmetric maximal ideal of $\mathrm{M}(\mathrm{G})$ such that:

$$
\sigma \supset \mathrm{L}_{1}(\mathrm{G}) \quad \text { and } \quad \sigma \nsim \mathrm{M}_{0}(\mathrm{G}) .
$$

## 7. Theorem R.

We start from a lemma on locally compact abelian groups :
Lemma 7.1. - (i) If G is a metrisable, locally compact group, and if it has $\mathrm{S}^{*}$-measures, then it also has an $\mathrm{S}^{*}$-measure $\lambda$, such that $\mathrm{O}_{\mathrm{G}} \notin s(\lambda)$ and $s(\lambda)$ is totally disconnected.
(ii) If G is a locally compact group, and if $\Omega$ is an open subgroup, and if $\Omega$ contains R -sets, then G contains R -sets also.

Proof. - (i) Indeed if $\nu$ is an $\mathrm{S}^{*}$-measure of G then it suffices to find $0 \neq \lambda \leqslant \nu$ and such that $\mathrm{O}_{G} \notin s(\lambda)$ and $s(\lambda)$ is totally disconnected. This can be done using simple arguments of general topology and Radon measure theory.
(ii) It is trivial.

Remarks. - (7.i) In general if $\mu$ is an S-measure, $s(\mu)$ has no isolated points since $\mu \in \mathrm{M}_{0}(\mathrm{G})$. Thus in the above Lemma 7.1(i) $s(\lambda)$ is a Cantor set.

Let now $G$ for the rest of this paragraph denote an abelian, metrisable, countable at infinity, locally compact group, and let us fix on it $d$ a translation invariant metric. Let us also fix $\lambda$ an $\mathrm{S}^{*}$-measure on G which is as in Lemma 7.1(i) i.e. $\mathrm{O}_{\mathrm{G}} \notin s(\lambda)=\Lambda$ and $\Lambda$ is a Cantor set, and let us normalise it by: $\|\lambda\|=1$.

Then by the hypothesis on $\lambda$ and G we have for :

$$
j=0,1,2, \ldots ; \Lambda=\bigcup_{\alpha=1}^{2^{j}} \Lambda_{j}^{\alpha}
$$

where $\left\{\Lambda_{j}^{\alpha}\right\} ; j=0,1,2, \ldots, 1 \leqslant \alpha \leqslant 2^{j}$ are compact sets satisfying:
( $\alpha$ ) $\Lambda_{j}^{\alpha} \cap \Lambda_{j}^{\beta}=\varnothing$ for $\alpha \neq \beta$ and all $j \geqslant 0$
( $\beta$ ) $\sup _{1 \leqslant \alpha \leq j^{j}}\left(\operatorname{diam} \Lambda_{j}^{\alpha}\right) \xrightarrow[j>\infty]{ } 0$ where of course for any
$\mathrm{E} \subseteq \mathrm{G} \operatorname{diam} \mathrm{E}=\sup _{e_{1}, e_{2} \in \mathrm{E}} d\left(e_{1}, e_{2}\right)$
( $\gamma$ ) $\Lambda_{j}^{\alpha} \supseteq \Lambda_{j+1}^{\alpha} \cup \Lambda_{j+1}^{j+\alpha} \quad$ for $\quad j \geqslant 0 \quad$ and $\quad 1 \leqslant \alpha \leqslant 2^{j}$.
Let us also denote by:

$$
\lambda_{j}^{\alpha}=\xi_{\Lambda_{j}^{\alpha}} \lambda \in \mathrm{M}_{0}^{+}(\mathrm{G}) \quad \text { for all } \quad j \geqslant 0 ; \quad 1 \leqslant \alpha \leqslant 2^{j}
$$

Let us now denote:
$\mathrm{G}^{j}=\prod_{\alpha=1}^{2^{j}} \mathrm{G}_{\alpha} \quad$ with $\quad \mathrm{G}_{\alpha}=\mathrm{G}, \quad 1 \leqslant \alpha \leqslant 2^{i} \quad$ for $\quad j \geqslant 0$
and for all $g^{j}=\left(g_{1}^{j}, g_{2}^{j}, \ldots, g_{2}^{j}\right) \in \mathrm{G}^{j}$ and $x \in \mathrm{G}$.
Let us define:

$$
\begin{align*}
& \text { ( } \alpha \text { ) } \Lambda_{j}^{\alpha}[x]=x+\Lambda_{j}^{\alpha} ; j \geqslant 0,1 \leqslant \alpha \leqslant 2^{j}  \tag{7.2}\\
& \text { ( } \beta \text { ) } \lambda_{j}^{\alpha}[x]=\delta_{x} \star \lambda_{j}^{\alpha} \in \mathrm{M}_{0}^{+}(\mathrm{G}) ; j \geqslant 0,1 \leqslant \alpha \leqslant 2^{j} \\
& \text { (ү) } \lambda\left[g^{j}\right]=\sum_{\alpha=1}^{j} \lambda_{j}^{\alpha}\left[g_{\alpha}^{j}\right] \in \mathrm{M}_{0}^{+}(\mathrm{G}) ; j \geqslant 0 .
\end{align*}
$$

We have of course:

$$
\left\|\lambda\left[g^{j}\right]\right\|=1, \quad \lambda\left[g^{j}\right] \geqslant 0, \quad s\left(\lambda\left[g^{j}\right]\right) \subseteq \bigcup_{\alpha=1}^{2^{j}} \Lambda_{j}^{\alpha}\left[g_{\alpha}^{j}\right] .
$$

We then compute, taking (7.1) and (7.2) into account for all $j \geqslant 0$ and $\chi \in \hat{G}$ :

$$
\begin{array}{r}
\left(\lambda\left[g^{j}\right]\right)^{\wedge}(\chi)-\left(\lambda\left[g^{j+1}\right]\right)^{\wedge}(\chi)=\sum_{\alpha=1}^{2^{j}}\left\{\left(\lambda_{j+1}^{\alpha}\left[g_{\alpha}^{j}\right]\right)^{\wedge}(\chi)-\left(\lambda_{j+1}^{\alpha}\left[g_{\alpha}^{j+1}\right]\right)^{\wedge}(\chi)\right\} \\
+\sum_{\alpha=1}^{2^{j}}\left\{\left(\lambda_{j+1}^{\alpha+2^{j}}\left[g_{\alpha}^{j}\right]\right)^{\wedge}(\chi)-\left(\lambda_{j+1}^{\alpha+2^{j}}\left[g_{\alpha+2^{j}}^{j+1}\right]\right)^{\wedge}(\chi)\right\}
\end{array}
$$

and using (7.2) and (7.3) and observing that

$$
\left(\lambda_{j}^{\alpha}[x]\right)^{\wedge}(\gamma)=\chi(x) \hat{\lambda}_{j}^{\alpha}(\chi) \quad \text { for } \quad x \in G,
$$

we see that there exists $\left\{\varepsilon_{j}>0\right\}_{j=0}^{\infty}$ such that:

$$
g^{j} \in \mathrm{G}^{j} \quad \text { for all } \quad j \geqslant 0 ; \quad g^{0}=\mathrm{O}_{\mathrm{G}} \in \mathrm{G}^{0}=\mathrm{G} ;
$$

for all $j \geqslant 0$

$$
\begin{array}{r}
\mathrm{D}\left[g^{j}, g^{j+1}\right]=\sup \left\{d\left(g_{\alpha}^{j}, g_{\alpha}^{j+1}\right)+d\left(g_{\alpha}^{j}, g_{\alpha+2 j}^{j+1}\right) ;\right.  \tag{7.4}\\
\left.1 \leqslant \alpha \leqslant 2^{j}\right\} \leqslant \varepsilon_{j}
\end{array}
$$

implies :

$$
\begin{equation*}
\sup _{\chi}\left|\left(\lambda\left[g^{j}\right]\right)^{\wedge}(\chi)-\left(\lambda\left[g^{+1}\right]\right)^{\wedge}(\chi)\right| \leqslant 2^{-j} \tag{7.5}
\end{equation*}
$$

and

$$
s\left(\lambda\left[g^{j}\right]\right) \subseteq \Lambda+\mathrm{K} \quad \text { for } \quad j \geqslant 0
$$

and K some compact neighbourhood of $\mathrm{O}_{\mathrm{G}}$.
From (7.5) it follows at once that if $\left\{g^{j}\right\}_{j=0}^{\infty}$ is a sequence satisfying (7.4) then $\lambda\left[g^{j}\right] \rightarrow l$ for the vague topology of measures and by (7.3).

$$
\begin{equation*}
l \geqslant 0, \quad\|l\|=1, \quad l \in \mathrm{M}_{0}(\mathrm{G}) \tag{7.6}
\end{equation*}
$$

Let us now denote for all $j \geqslant 0$ :
$\mathbf{\Sigma}=\left\{n \in \mathbf{Z} ; \tau_{n}(\mathrm{G}) \neq \mathrm{O}_{\mathrm{G}}\right\} \subseteq \mathbf{Z}$
$\Sigma_{j}=\left\{\left(n_{\alpha} \in \mathbf{Z}\right)_{\alpha=1}^{j} ;\left|n_{\alpha}\right| \leqslant j+1\right.$ for $1 \leqslant \alpha \leqslant 2^{j}$,

$$
\left.\left.\sum_{\alpha=1}^{2^{j}} \tau_{n_{\alpha}} \mathrm{G}\right) \neq \mathrm{O}_{\mathrm{G}}\right\}
$$

and let us also denote for $j \geqslant 0$ :

$$
\mathrm{H}_{j}=\bigcup_{\left(n_{\alpha}\right)_{\alpha=1}^{j} \in \mathrm{\Sigma}_{j}}\left\{g^{j} \in \mathrm{G}^{j} ; \sum_{\alpha=1}^{2^{j}} n_{\alpha} g_{\alpha}^{j}=\mathrm{O}_{\mathrm{G}}\right\} \subseteq \mathrm{G}^{j}
$$

and for $j \geqslant 0$

$$
\mathrm{K}_{j}=\bigcup_{\left(n_{\alpha^{2}}\right)_{\alpha=1}^{2} \in \mathrm{\Sigma}_{j}}\left\{g^{j} \in \mathrm{G}^{j} ; \quad \sum_{\alpha=1}^{2^{j}} n_{\alpha} g_{\alpha}^{j} \in \mathrm{G} p \Lambda\right\} \subseteq \mathrm{G}^{j}
$$

We observe at once that:

$$
\begin{equation*}
h_{\mathrm{G}^{\prime}}\left(\mathrm{K}_{j}\right)=0 \quad \text { for } \quad j \geqslant 0 \tag{7.7}
\end{equation*}
$$

indeed by the definition of $\Sigma, \Sigma_{j}$ and $K_{j}$ to prove (7.7) it suffices to prove that:
if $j \geqslant 0,1 \leqslant \alpha \leqslant 2^{j}$ and $n_{\alpha_{0}} \in \Sigma \subset \mathbf{Z}$ and $n_{\alpha} \in \mathbf{Z}$ for $\alpha \neq \alpha_{0}$ arbitrary, then :

$$
h_{\mathrm{G}^{j}}\left[g^{j} \in \mathrm{G}^{j} ; \quad \sum_{\alpha=1}^{2^{j}} n_{\alpha} g_{\alpha}^{j} \in \mathrm{G} p \Lambda\right]=0
$$

and that follows from Fubini's theorem and the fact that the section of the set $\left[g^{j} \in \mathrm{G}^{j} ; \sum_{\alpha=1}^{2 j} n_{\alpha} g_{\alpha}^{j} \in \mathrm{G} p \Lambda\right]$ by the "plane"

$$
\left.\begin{array}{c}
g_{\alpha}^{j}=x_{\alpha} \\
\mathrm{S}(x) \cong
\end{array} \quad \text { for } \quad \alpha \neq \alpha_{0} ; \quad 1 \leqslant \alpha \leqslant 2^{j} \text { is } \quad \begin{array}{l}
\mathrm{g} \in \mathrm{G} ; \\
n_{\alpha_{0} g \in-} \sum_{\alpha \neq \alpha_{0}} n_{\alpha} x_{\alpha}+\mathrm{G} p \Lambda
\end{array}\right]
$$

and so is either $\varnothing$ or a coset of a subgroup of G of measure zero by the definition of $\lambda$ an $S^{*}$-measure of $G$, and the definition of $\Sigma$.

We then prove:
Lemma 7.2. - For all $j \geqslant 1$ and $g^{j-1} \in \mathrm{G}^{j-1}$ and $\varepsilon>0$ we can find $g^{j}=\left\{g_{\alpha}^{j}\right\}_{\alpha=1}^{2 j} \in \mathrm{G}^{j}$ such that:

$$
\mathrm{D}\left[g^{j-1}, g^{j}\right]<\varepsilon \quad \text { and } \quad\left(\prod_{\alpha=1}^{2^{j}} \Lambda_{j}^{\alpha}\left[g_{\alpha}^{j}\right]\right) \cap \mathrm{H}_{j}=\varnothing .
$$

Proof. - Observe that for $j \geqslant 1$ :

$$
\begin{equation*}
\left(\prod_{\alpha=1}^{2^{j}} \Lambda_{j}^{\alpha}\left[g_{\alpha}^{j}\right]\right) \cap \mathrm{H}_{j} \neq \varnothing \Rightarrow g^{j} \in \mathrm{~K}_{j} \subset \mathrm{G}^{j} ; \tag{7.8}
\end{equation*}
$$

it is also trivial, since $\left\{g^{j} \in \mathrm{G}^{j} ; \mathrm{D}\left[g^{j-1}, g^{j}\right]<\varepsilon\right\} \subset \mathrm{G}^{j}$ is an open
subset, that:
(7.9) $h_{\mathrm{G}^{j}}\left[g^{j} \in \mathrm{G}^{j} ; \quad \mathrm{D}\left[g^{j-1}, g^{j}\right]<\varepsilon\right]>0 \quad j \geqslant 1$.

Thus the Lemma follows by comparing (7.7), (7.8) and (7.9).
Now we choose inductively three families:

$$
\left\{g^{j}=\left(g_{\alpha}^{j}\right)_{\alpha=1}^{2^{j}} \in \mathrm{G}^{j}\right\}_{j=0}^{\infty}, \quad\left\{\eta_{j}>0\right\}_{j=0}^{\infty}, \quad\left\{\rho_{j}>0\right\}_{j=0}^{\infty}
$$

satisfying for all $j \geqslant 0$ the following conditions:

$$
\begin{equation*}
g^{0}=\mathrm{O}_{\mathrm{G}} \quad \text { and } \quad \mathrm{D}\left[g^{j}, g^{j+1}\right]<\eta_{j} \tag{i}
\end{equation*}
$$

(ii)
(iii)

$$
\begin{equation*}
\left(\prod_{\alpha=1}^{2^{j}}\left(\Lambda_{j}^{\alpha}\left[g_{\alpha}^{j}\right]\right)_{\rho_{j}}\right) \cap \mathrm{H}_{j}=\varnothing \tag{iv}
\end{equation*}
$$

where for any $\mathrm{E} \subset \mathrm{G}$ and any

$$
\begin{align*}
& \rho>0 \quad \mathrm{E}_{\rho}=\{x \in \mathrm{G} ; \quad d(x, \mathrm{E}) \leqslant \rho\} \\
& \rho_{j} \leqslant \frac{1}{j+1} \tag{v}
\end{align*}
$$

To see how that choice is carried out, suppose that for some $j \geqslant 0 g^{j} \in \mathrm{G}^{j}$ has been chosen such that:

$$
\left(\prod_{\alpha=1}^{2^{j}} \Lambda_{j}^{\alpha}\left[g_{\alpha}^{j}\right]\right) \cap \mathrm{H}_{j}=\varnothing
$$

Then we can choose $p_{j} \leqslant \frac{1}{j+1}$ such that (iv) above holds, and impose on the $\left\{\eta_{k}\right\}_{k=j}^{\infty}$ the condition that they are small enough so that (ii) and (iii) hold. Then using Lemma (7.2) we can choose $g^{j+1} \in \mathrm{G}^{j+1}$ such that (i) holds and that

$$
\left(\prod_{\alpha=1}^{2 j+1} \Lambda_{j+1}^{\alpha}\left[g_{\alpha}^{j+1}\right]\right) \cap \mathrm{H}_{j+1}=\phi
$$

And that completes the indective step. The induction starts trivially since $\mathrm{H}_{0}=\left\{\mathrm{O}_{\mathrm{G}}\right\} \subseteq \mathrm{G}$ and thus :

$$
\Lambda\left[g^{0}\right] \cap \mathrm{H}_{0}=\Lambda \cap\left\{\mathrm{O}_{\mathrm{G}}\right\}=\varnothing
$$

Now by (i) and (iii) as well as by (7.4) and (7.5) and (7.6) for such a choice of $\left\{g^{j}\right\}_{j=0}^{\infty}, \lambda\left[g^{j}\right] \rightarrow l \in \mathrm{M}_{0}(\mathrm{G})$ for the vague
topology of measures and $\|l l\|=1$. Also from (7.2) and (7.3) and (i), (ii) and (iii) above it follows that for $i \geqslant j \geqslant 0$

$$
s\left(\lambda\left[g_{j}\right]\right) \subseteq \bigcup_{\alpha=1}^{2 j}\left(\Lambda_{j}^{\alpha}\left[g_{\alpha}^{j}\right]\right)_{\rho j}=\mathrm{X}_{j} ;
$$

and thus also $s(l) \subset \mathrm{X}_{j}$ for all $j \geqslant 0$, and so $s(l) \subseteq \bigcap_{j=0}^{\infty} \mathrm{X}_{j}$. And from that we see that the relations (iv) and (v) and the conditions (7.1) imply that $s(l)$ is a strongly independent set; in fact rather more can be asserted, namely:
"For any $\mathrm{N} \in \mathbf{Z}, \mathrm{N} \geqslant 1$, and any $\left\{\sigma_{k} \in s(l)\right\}_{k=1}^{\mathrm{N}}$ distinct points, if $\left(n_{k} \in \mathbf{Z}\right)_{k=1}^{\mathbb{N}}$ are such that $\sum_{k=1}^{\mathbb{N}} n_{k} \sigma_{k}=\mathrm{O}_{\mathrm{G}}$, then for all $1 \leqslant k \leqslant \mathrm{~N} n_{k} \notin \Sigma$, which implies that $\tau_{n_{k}}(\mathrm{G})=\mathrm{O}_{\mathrm{G}}$ ).

Thus we have proved the:
Lemma 7.3. - If G is a metrisable locally compact group and if it has $\mathrm{S}^{*}$-measures then it has R -sets.

Proof of Theorem R. - The Lemma 7.3 the corollary 6.2 put together with the Lemma 7.1(ii) imply Theorem $R$ at once.

Remarks. - (7.ii) Observe that the condition of metrisability cannot be relaxed for the construction of R -sets. Indeed if $\mu \in M_{0}(G)$, for $G$ a non metrisable compact group, then

$$
|\operatorname{supp} \hat{\mu}| \leqslant \aleph_{0},
$$

and thus there exists $\nu \in \mathrm{G} /[\mathrm{Gp}(\operatorname{supp} \hat{\mu})]^{0}$ such that $\mu$ can be identified canonically with $\nu$ (as in [1] ch. 7). Thus in particular $s(\mu)$ must contain a coset of $[\mathrm{G} p(\operatorname{supp} \hat{\mu})]^{0}$, which is a non trivial group ( $[\mathrm{G} p(\operatorname{supp} \hat{\mu})]^{0}$ is not even metrisable); and thus $s(\mu)$ cannot be independent.
(7.iii) Any metrisable R-set contains a totally disconnected R-set (cf. Lemma 7.1).

We finish up the paragraph by stating without proof what we think is the main application of Theorem R.

If for any algebra R we denote:

$$
\mathrm{R}^{2}=\left\{\sum_{j=0}^{\mathrm{N}} \lambda_{j} x_{j} y_{j} \mid \mathrm{N} \geqslant 1 ; \lambda \in \mathrm{G} ; x_{j}, y_{j} \in \mathrm{R}\right\}
$$

and if we denote the algebra of continuous measures:

$$
\mathrm{M}_{c}(\mathrm{G})=\{m \in \mathrm{M}(\mathrm{G}) ; \quad \forall x \in \mathrm{G}\{x\} \text { is a } m \text {-null set }\}
$$

which is seen at once to be a closed ideal of $M(G)$ then we have :
Application. - For any $G$ non discrete locally compact abelian group :
(i) $M_{c} / \overline{M_{c}^{2}}$ is a non separable Banach space.
(ii) $\mathrm{M}_{0} / \overline{\mathrm{M}_{0}^{2}}$ is an infinite dimensional Banach space.
(iii) If in addition $G$ is metrisable then :

$$
\mathrm{M}_{0} \oplus \overline{\mathrm{M}_{c}^{2}} .
$$

The proof of that result will be given in a publication which will follow this one [9].

I should like to finish up by expressing my gratitude to the C.N.R.S. for supporting this research financially, and to the Département de Mathématiques de la Faculté des Sciences d'Orsay, that offered to me for the second year running its generous hospitality.
