# CONSTRUCTING MANIFOLDS BY HOMOTOPY EQUIVALENCES I. AN OBSTRUCTION TO CONSTRUCTING PL-MANIFOLDS FROM HOMOLOGY MANIFOLDS 

by Hajime SATO

## 0. Introduction.

A homology manifold can be given a canonical cell complex structure, where each cell is a contractible homology manifold. In this paper, given a homology manifold M , we aim at constructing a PL-manifold with a cell complex structure, where each cell is an acyclic PL-manifold, which is cellularly equivalent to the canonical cell complex structure of M. We obtain a theorem that, if the dimension $n$ of M is greater than 4 and if the boundary $\partial \mathrm{M}$ is a PL-manifold or empty, there is a unique obstruction element in $\mathrm{H}_{n-4}\left(\mathrm{M} ; \mathcal{H e}^{3}\right)$, where $\mathscr{H}^{3}$ is the group of 3 -dimensional PL-homology spheres modulo those which are the boundary of an acyclic PL-manifold. If the manifold is compact, the constructed PL-manifold is simple homotopy equivalent to M .

I have heard that similar results have been obtained independently and previously by M. Cohen and D. Sullivan, refer [1] and [9].

I would like to thank Professors V. Poénaru and F. Laudenbach for their kind support.

1. Definition of homology manifold with boundary $\left({ }^{1}\right)$.

Let K be a locally finite simplicial complex and let $\sigma$ be a simplex of $K$. We define the subcomplexes of $K$ as follows.

[^0]\[

$$
\begin{gathered}
\mathrm{St}(\sigma, \mathrm{~K})=\operatorname{St}(\sigma)=\{\tau \in \mathrm{K}, \exists \alpha>\tau, \alpha>\sigma\} \\
\partial \mathrm{S} t(\sigma, \mathrm{~K})=\partial \mathrm{S} t(\sigma)=\{\tau \in \mathrm{St}(\sigma), \tau \ngtr \sigma\} \\
\mathrm{L} k(\sigma, \mathrm{~K})=\mathrm{L} k(\sigma)=\{\tau \in \mathrm{S} t(\sigma), \tau \cap \sigma=\varnothing\}
\end{gathered}
$$
\]

We write by $K^{\prime}, K^{\prime \prime}$, the first and the second barycentric subdivisions of $K$.

Let M be a locally finite full simplicial complex of dimension $n$. We say that M is a homology manifold of dimension $n$ if the following equivalent condition holds :

Lemma 1. - The followings are equivalent:
i) for any simplex $\sigma$ of dimension $p$,

$$
\widetilde{\mathrm{H}}_{i}(\mathrm{~L} k(\sigma, \mathrm{M}))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{n-p-1}\right) \quad \text { or } \quad 0 .
$$

ii) for any simplex $\sigma$ of dimension $p$,

$$
\widetilde{\mathrm{H}}_{i}(\mathrm{~S} t(\sigma, \mathrm{M}) / \partial \mathrm{S} t(\sigma, \mathrm{M}))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{n}\right) \quad \text { or } \quad 0
$$

iii) for any point $x$ of $|\mathrm{M}|$, where $|\mathrm{M}|$ denotes the underlying topological space of M ,

$$
\mathrm{H}_{i}(|\mathrm{M}|,|\mathrm{M}|-x)=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{n}\right) \quad \text { or } \quad 0 .
$$

The definition is invariant by the PL-homeomorphism in the category of simplicial complexes.

Lemma 2. - For any p-simplex $\sigma$ of $\mathrm{M}, \mathrm{L} k(\sigma, \mathrm{M})$ is a compact ( $n-p-1$ )-dimensional homology manifold.

Proof. - It is compact because M is locally finite. Let $\tau$ be a $q$ simplex of $\operatorname{Lk}(\sigma, \mathrm{M})$. We have

$$
\mathrm{L} k(\tau, \mathrm{~L} k(\sigma, \mathrm{M}))=\mathrm{L} k(\tau \sigma, \mathrm{M})
$$

Hence $\widetilde{\mathrm{H}}_{i}(\operatorname{Lk}(\tau, \operatorname{Lk}(\sigma, \mathrm{M})))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{n-p-q-1}\right)$ or 0 , which completes the proof.

Let us define the subset $\partial \mathrm{M}$ of M by

$$
\partial \mathrm{M}=\left\{\sigma \in \mathrm{M} \mid \widetilde{\mathrm{H}}_{i}(\sigma, \mathrm{M})=0\right\}
$$

We call it as the boundary of M . If $\partial \mathrm{M}=\phi$, the manifold is classical
and the following Poincaré duality is well known (see for example [7; 7,4$)]$ ).

Lemma 3. - Let M be an orientable compact n-dimensional homology manifold without boundary. Let $\mathrm{A}_{1} \supset \mathrm{~A}_{2}$ be subcomplexes of M. Then we have the isomorphism

$$
\mathrm{H}^{i}\left(\mathrm{~A}_{1}, \mathrm{~A}_{2}\right)=\mathrm{H}_{n-i}\left(|\mathrm{M}|-\left|\mathrm{A}_{2}\right|,|\mathrm{M}|-\left|\mathrm{A}_{1}\right|\right)
$$

Using this we will prove the followings. By lemma 2, for $p$ simplex $\sigma, \operatorname{Lk}(\sigma, \mathrm{M})$ is a homology manifold and we can define $\partial \mathrm{Lk}(\sigma, \mathrm{M})$.

Lemma 4. - If $\partial \mathrm{L} k(\sigma, \mathrm{M}) \neq \emptyset, \operatorname{L} k(\sigma, \mathrm{M})$ is acyclic and $\partial \mathrm{L} k(\sigma, \mathrm{M})$ is an ( $n-p-2$ )-dimensional homology manifold such that

$$
\widetilde{\mathrm{H}}_{i}(\partial \mathrm{~L} k(\sigma, \mathrm{M}))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{n-p-2}\right) .
$$

Proposition 5. - If $\partial \mathrm{M} \neq \emptyset$, $\partial \mathrm{M}$ is a subcomplex and is an ( $n-1$ )-dimensional homology manifold without boundary.

We prove that lemma 4 for $n=k$ implies proposition 5 for $n=k$ and proposition 5 for $n \leqslant k$ implies lemma 4 for $n=k+1$. Since lemma 4 holds for $n=1$, we can continue by induction.

Lemma $4_{n=k} \Rightarrow$ Proposition $5_{n=k}$. Let $\sigma$ be a $p$-simplex of $\partial \mathrm{M}$ and let $\sigma_{0}<\sigma$. Then we can write $\sigma=\sigma_{0} \sigma_{1}$. We have

$$
\widetilde{\mathrm{H}}_{*}\left(\mathrm{~L} k\left(\sigma_{1}, \mathrm{~L} k\left(\sigma_{0}, \mathrm{M}\right)\right)\right)=\widetilde{\mathrm{H}}_{*}(\mathrm{~L} k(\sigma, \mathrm{M}))=0
$$

which shows that $\sigma_{1} \in \partial \operatorname{Lk}\left(\sigma_{0}, \mathrm{M}\right)$ and so $\partial \operatorname{Lk}\left(\sigma_{0}, \mathrm{M}\right) \neq \emptyset$. By the lemma $4, L k\left(\sigma_{0}, \mathrm{M}\right)$ is acyclic and it follows that $\sigma_{0} \in \partial \mathrm{M}$. Hence $\partial \mathrm{M}$ is a well-defined subcomplex of M. A $q$-simplex $\tau$ of $L k(\sigma, \mathrm{M})$ is in $L k(\sigma, \partial \mathrm{M})$ if and only if $\widetilde{\mathrm{H}}_{i}(\mathrm{~L} k(\tau \sigma, \mathrm{M}))=0$. Since

$$
\mathrm{L} k(\tau \sigma, \mathrm{M})=\mathrm{L} k(\tau, \mathrm{~L} k(\sigma, \mathrm{M}))
$$

it is equivalent to that $\tau$ belongs to $\partial \mathrm{L} k(\sigma, \mathrm{M})$. Hence the complex $\underset{\sim}{L} k(\sigma, \partial \mathrm{M})$ coincides with $\partial \mathrm{L} k(\sigma, \mathrm{M})$. By lemma $4_{k}$, we have $\widetilde{\mathrm{H}}_{i}(\partial \mathrm{~L} k(\sigma, \mathrm{M}))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{k-p-2}\right)$, which shows that $\partial \mathrm{M}$ is a $(k-1)$ dimensional homology manifold without boundary.

Proposition $5_{n} \leqslant k \Rightarrow$ Lemma $4_{n=k+1}$. Let $M$ be a homology manifold of dimension $k+1$. Let $\sigma$ be a $p$-simplex of M. By lemma 2,
$\mathrm{L} k(\sigma, \mathrm{M})$ is a homology manifold of dimension $k-p$. By proposition 5 for $n=k-p, \partial \mathrm{~L} k(\sigma, \mathrm{M})$ is a $(k-p-1)$-dimensional homology manifold without boundary if it is not empty. Let $2 \mathrm{~L} k(\sigma, \mathrm{M})$ be the double of $L k(\sigma, \mathrm{M})$, i.e.,

$$
2 \mathrm{~L} k(\sigma, \mathrm{M})=\mathrm{L} k(\sigma, \mathrm{M}) \underset{\partial \mathrm{L} k(\sigma, \mathrm{M})}{\cup} \mathrm{L} k(\sigma, \mathrm{M})
$$

Let $\tau$ be a $q$-simplex of $2 \mathrm{~L} k(\sigma, \mathrm{M})$. If $\tau$ is not a simplex of $\partial \mathrm{L} k(\sigma, \mathrm{M})$, clearly,

$$
\widetilde{\mathrm{H}}_{i}\left(\operatorname{Lk}\left(\tau, 2 \operatorname{Lk}\left(\sigma, \mathrm{~N}_{1}\right)\right)\right)=\widetilde{\mathrm{H}}_{i}(\operatorname{L} k(\tau, \operatorname{L} k(\sigma, \mathrm{M})))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{k-p-q-1}\right)
$$

If $\tau$ is a simplex of $\partial \mathrm{L} k(\sigma, \mathrm{M})$, we have
$\operatorname{Lk}(\tau, 2 \operatorname{Lk}(\sigma, \mathrm{M}))$

$$
=\mathrm{L} k(\tau, \mathrm{~L} k(\sigma, \mathrm{M})) \underset{\mathrm{L} k(\tau, \partial \mathrm{~L} k(\sigma, \mathrm{M}))}{\cup} \mathrm{L} k(\tau, \mathrm{~L} k(\sigma, \mathrm{M}))
$$

By definition $\widetilde{\mathrm{H}}_{i}(\mathrm{~L} k(\tau, \mathrm{~L} k(\sigma, \mathrm{M})))=0$ and by the proposition 5 for $n=k-p-1$, we have

$$
\widetilde{\mathrm{H}}_{i}(\mathrm{~L} k(\tau, \partial \mathrm{~L} k(\sigma, \mathrm{M})))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{k-p-q-2}\right)
$$

Hence in any case $\widetilde{\mathrm{H}}_{i}(\operatorname{Lk}(\tau, 2 \operatorname{Lk}(\sigma, \mathrm{M})))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{k-p-q-1}\right)$, which shows that $2 \mathrm{~L} k(\sigma, \mathrm{M})$ is a $(k-p)$-dimensional homology manifold without boundary. Applying lemma 3, we have

$$
\mathrm{H}^{i}(\mathrm{~L} k(\sigma, \mathrm{M}), \partial \mathrm{L} k(\sigma, \mathrm{M}))=\mathrm{H}_{k-p-i}(|\mathrm{~L} k(\sigma, \mathrm{M})|-|\partial \mathrm{L} k(\sigma, \mathrm{M})|)
$$

Notice that for any homology manifold M, $H_{i}(|\mathrm{M}|-|\partial \mathrm{M}|)=\mathrm{H}_{i}(\mathrm{M})$. Hence $\mathrm{H}^{i}(\mathrm{~L} k(\sigma, \mathrm{M}), \quad \partial \mathrm{L} k(\sigma, \mathrm{M}))=\mathrm{H}_{k-p-i}\left(\mathrm{~S}^{k-p}\right)$ or $\mathrm{H}_{k-p-i}(p t$.$) .$ But if it is isomorphic to $\mathrm{H}_{k-p-i}\left(\mathrm{~S}^{k-p}\right)$, we have

$$
\mathrm{H}^{0}(\mathrm{~L} k(\sigma, \mathrm{M}), \partial \mathrm{L} k(\sigma, \mathrm{M}))=\mathrm{Z}
$$

which contradicts to the definition that $\widetilde{\mathrm{H}}_{0}(\mathrm{~L} k(\sigma, \mathrm{M}))=0$. Hence $\operatorname{Lk}(\sigma, \mathrm{M})$ is acyclic and consequently $\widetilde{\mathrm{H}}_{i}(\partial \mathrm{~L} k(\sigma, \mathrm{M}))=\widetilde{\mathrm{H}}_{i}\left(\mathrm{~S}^{k-p-1}\right)$, which completes the proof.

## 2. Cell decomposition of a homology manifold.

We mean by a homology cell (resp. pscudo homology cell) of dimension $n$ or homology $n$-cell (resp. pseudo homology $n$-cell) a
compact contractible (resp. acyclic) homology manifold of dimension $n$ with a boundary, the boundary being a homology sphere but not necessarily simply connected. A (pseudo) homology cell complex is a complex K with a locally finite family of (pseudo) homology cells $\mathrm{C}=\left\{\mathrm{C}_{\alpha}\right\}$, such that :
i) $K=\cup C_{\alpha}$
ii) $\mathrm{C}_{\alpha}, \mathrm{C}_{\beta} \in \mathrm{C}$ implies $\partial \mathrm{C}_{\alpha}, \mathrm{C}_{\alpha} \cap \mathrm{C}_{\beta}$ are unions of cells in C
iii) If $\alpha \neq \beta$, then Int $C_{\alpha} \cap \operatorname{Int} C_{\beta}=\varnothing$.

If a homology manifold M has a (pseudo) homology cell complex structure, we call it a (pseudo) cellular decomposition of M. Two (pseudo) homology cell complexes $K=\cup \mathrm{C}_{\alpha}, \mathrm{K}^{\prime}=\cup \mathrm{C}_{\alpha}^{\prime}$ are isomorphic if there exists a bijection $k: \mathrm{C} \rightarrow \mathrm{C}^{\prime}$ such that both $k$ and $k^{-1}$ are incidence preserving. In such a case we say that they are cellularly equivalent.

Now we have the following :

Proposition 1. - If two finite homology cell complexes $\mathrm{K}, \mathrm{K}^{\prime}$ are cellularly equivalent, then they are simple homotopy equivalent.

We can define a simplicial $\operatorname{map} f: K \rightarrow \mathrm{~K}^{\prime}$ inductively by the dimension of the cells. Hence it is sufficient to prove the following lemma.

Lemma 2. - Let $\mathrm{A}_{j}^{i}(j=1,2, \ldots, r)$ be subcomplex of simplicial complexes $\mathrm{B}^{i}$ for $i=1,2$ respectively such that $\mathrm{B}^{i}=\underset{j}{\cup} \mathrm{~A}_{j}^{i}$, and let $f: \mathrm{B}^{1} \rightarrow \mathrm{~B}^{2}$ be a simplicial map. For any subset $s$ of $\{1,2, \ldots, r\}$, let $\mathrm{A}_{s}^{i}=\cap_{j \in s} \mathrm{~A}_{j}^{i}$ and let $f_{s}$ be the restriction of f on $A_{s}$. If $f_{s}$ is a mapping from $\mathrm{A}_{s}^{1}$ to $\mathrm{A}_{s}^{2}$ which is a simple homotopy equivalence for any $s$, then $f$ itself is a simple homotopy equivalence.

Proof. - First suppose that $r=2$. We have the exact sequence

$$
\left.0 \rightarrow \mathrm{C}_{*}\left(\mathrm{~A}_{1}^{i}\right) \rightarrow \mathrm{C}_{*}\left(\mathrm{~B}^{i}\right) \rightarrow \mathrm{C}_{*}\left(\mathrm{~A}_{1}^{i} \cap \mathrm{~A}_{2}^{i}\right)\right) \rightarrow 0
$$

of the chain complexes. Let $g: \mathrm{A}_{2}^{1} /\left(\mathrm{A}_{1}^{1} \cap \mathrm{~A}_{2}^{1}\right) \rightarrow \mathrm{A}_{2}^{2} /\left(\mathrm{A}_{1}^{2} \cap \mathrm{~A}_{2}^{2}\right)$ be the map induced by $f$ and let us denote by $w()$ the Whitehead torsion. Then by theorem 10 of [8], we have

$$
w(f)=w\left(f_{\{1\}}\right)+w(g)
$$

Remark here that $f$ and $g$ can easily be seen to be homotopy equivalences. Further we have the exact sequence

$$
0 \rightarrow \mathrm{C}_{*}\left(\mathrm{~A}_{1}^{i} \cap \mathrm{~A}_{2}^{i}\right) \rightarrow \mathrm{C}_{*}\left(\mathrm{~A}_{2}^{i}\right) \rightarrow \mathrm{C}_{*}\left(\mathrm{~A}_{2}^{i} /\left(\mathrm{A}_{1}^{i} \cap \mathrm{~A}_{2}^{i}\right)\right) \rightarrow 0
$$

which shows that

$$
w\left(f_{\{2\}}\right)=w\left(f_{\{1,2\}}\right)+w(g)
$$

Since $w\left(f_{\{1\}}\right)=w\left(f_{\{2\}}\right)=w\left(f_{\{1,2\}}\right)=0$, we have $w(f)=0$. If $r \geqslant 3$, we can repeat this argument, which shows that $f$ is a simple homotopy equivalence for any $r$.

Now let $\sigma$ be a simplex of a locally finite simplicial complex $K$. We denote by $b_{\sigma} \in \mathrm{K}^{\prime}$ its barycenter. We define dualcomplex $\mathrm{D}(\sigma)$ and its subcomplex $\delta \mathrm{D}(\sigma)$ which are subcomplexes of $\mathrm{K}^{\prime}$ by

$$
\begin{gathered}
\mathrm{D}(\sigma)=\mathrm{D}(\sigma, \mathrm{~K})=\left\{b_{\sigma_{0}} \ldots b_{\sigma_{r}} \mid \sigma<\sigma_{0}<\ldots<\sigma_{r} \in \mathrm{~K}\right\} \\
\delta \mathrm{D}(\sigma)=\delta \mathrm{D}(\sigma, \mathrm{~K})=\left\{b_{\sigma_{0}} \ldots b_{\sigma_{r}} \mid \sigma \neq \sigma_{0}<\ldots<\sigma_{r} \in \mathrm{~K}\right\}
\end{gathered}
$$

The followings are easy to see.
i) if $\sigma<\sigma^{\prime} \Rightarrow \mathrm{D}(\sigma) \supset \mathrm{D}\left(\sigma^{\prime}\right)$
ii) $\mathrm{D}(\sigma)=b_{\sigma} * \delta \mathrm{D}(\sigma)$
iii) $\delta \mathrm{D}(\sigma)=\bigcup_{\tau} \mathrm{D}(\tau)$ where $\tau>\sigma$ and $\tau \neq \sigma$
iv) $\delta \mathrm{D}(\sigma)$ is isomorphic to $\operatorname{Lk}(\sigma, \mathrm{K})^{\prime}$.

Let M be a homology manifold. For each simplex

$$
\sigma=b_{\sigma_{0}} b_{\sigma_{1}} \ldots b_{\sigma_{r}}
$$

of $\mathrm{M}^{\prime}$, where $\sigma_{0}^{n_{0}}<\sigma_{1}^{n_{1}}<\ldots<\sigma_{r}^{n_{r}}$ are a set of simplexes of M , we have the duall cell $\mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right)$. It is a compact homology manifold by lemma 2 of $\S 1$. Further we have

$$
\begin{aligned}
\delta \mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right) & \cong \mathrm{L} k(\sigma, \mathrm{M}) \\
& \cong \mathrm{L} k\left(\sigma, \sigma_{r}\right) * \mathrm{~L} k\left(\sigma_{r}, \mathrm{M}\right) \\
& \cong \mathrm{S}^{n_{r}-r-1} * \mathrm{~L} k\left(\sigma_{r}, \mathrm{M}\right) \\
& \cong \mathrm{L} k\left(\sigma_{r}, \mathrm{M}\right) \times \mathrm{D}^{n_{r}-r} \cup\left(\mathrm{~L} k\left(\sigma_{r}, \mathrm{M}\right) *(p t .)\right) \times \mathrm{S}^{n_{r}-r-1}
\end{aligned}
$$

where $\cong$ denotes that both sides are PL-homeomorphic and let
$d_{\sigma}: \delta \mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right) \rightarrow \mathrm{L} k\left(\sigma_{r}, \mathrm{M}\right) \times \mathrm{D}^{n_{r}-r} \cup\left(\mathrm{~L} k\left(\sigma_{r}, \mathrm{M}\right) *\left(p t_{\mathrm{o}}\right)\right) \times \mathrm{S}^{n^{r}-r-1}$
be the PL-homeomorphism, which we call the trivialization of $\delta \mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right)$. If $\sigma$ is not in $\partial \mathrm{M}, \delta \mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right)$ is a homology manifold whose homology groups are isomorphic to those of $\mathrm{S}^{n-1}$, boundary being empty. If $\sigma \in \partial \mathrm{M}, \delta \mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right)$ is an acyclic homology manifold with the boundary $\mathrm{L} k\left(\sigma, \partial \mathrm{M}^{\prime \prime}\right)$ which is PL-homeomorphic to $\partial \mathrm{L} k\left(\sigma_{r}, \mathrm{M}\right) \times \mathrm{D}^{n_{r}-r} \cup\left(\partial \mathrm{~L} k\left(\sigma_{r}, \mathrm{M}\right) *(p t).\right) \times \mathrm{S}^{n_{r}^{-r-1}}$. The union $\mathrm{St}\left(\sigma, \partial \mathrm{M}^{\prime \prime}\right) \cup \delta\left(\sigma, \mathrm{M}^{\prime}\right)=\partial \mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right)$ is a homology manifold without boundary whose homology groups are isomorphic to those of $S^{n-1}$. Hence in any case $\mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right)$ is a homology cell. The union $\cup \mathrm{D}\left(\sigma, \mathrm{M}^{\prime}\right)$, $\sigma$ moving all simplexes of $\mathrm{M}^{\prime}$, gives the cellular decomposition of M , which we call the canonical one.

We define the handle $\mathrm{M}_{i}$ of index $i$ by the disjoint union

$$
\mathrm{M}_{i}=\cup \mathrm{D}\left(b_{\sigma^{n-i}}\right)
$$

where $\sigma$ changes all $(n-i)$-simplexes of M. We have $\delta \mathrm{D}\left(b_{\sigma}\right)=\cup \mathrm{D}(\tau)$, where $\sigma<\tau \in \mathrm{M}^{\prime}$, and it gives a cellular decomposition of $\mathrm{M}_{i}$. We can devide the boundary as $\delta \mathrm{D}\left(b_{\sigma}\right)=\operatorname{LD}\left(b_{\sigma}\right) \cup \mathrm{HD}\left(b_{\sigma}\right)$, which consists of unions of celles attached to the handles of lower indexes and higher indexes. We define them as

$$
\begin{aligned}
& \operatorname{LD}\left(b_{\sigma}\right)=\delta \mathrm{D}\left(b_{\sigma}\right) \cap\left(\cup_{j<i} \mathrm{M}_{j}\right) \\
& \operatorname{HD}\left(b_{\sigma}\right)=\delta \mathrm{D}\left(b_{\sigma}\right) \cap\left(\bigcup_{j>i} \mathrm{M}_{j}\right) .
\end{aligned}
$$

Let $\tau=b_{\tau_{0}} b_{\tau_{1}} \ldots b_{\tau_{r}} \neq \sigma$ be a simplex of $\mathrm{M}^{\prime}$, where

$$
\tau_{0}^{m_{0}}<\tau_{1}^{m_{1}} \cdots<\tau_{r}^{m_{r}} \in \mathrm{M}
$$

Then $\mathrm{D}(\tau) \in \mathrm{LD}\left(b_{\sigma}\right)$ if and only if $\tau_{r}>\sigma$ and $\mathrm{D}(\tau) \in \mathrm{HD}\left(b_{\sigma}\right)$ if and only if $\tau_{0}<\sigma$. It is easy to see that

$$
\begin{aligned}
& \mathrm{LD}\left(b_{\sigma}\right) \cong \operatorname{Lk}(\sigma, \mathrm{M}) \times \mathrm{D}^{n-i} \\
& \mathrm{HD}\left(b_{\sigma}\right) \cong(\mathrm{L} k(\sigma, \mathrm{M}) *(p t .)) \times \mathrm{S}^{n-i-1}
\end{aligned}
$$

and these isomorphism together give the trivialization $d_{b_{\sigma}}$ of $\delta \mathrm{D}\left(b_{\sigma}\right)$.

Let $\Delta^{n-i}$ be the standard ( $n-i$ )-simplex and let

$$
\partial \Delta^{n-i}=\mathrm{S}^{n-i-1}=\bigcup_{\alpha} \mathrm{C}_{\alpha}
$$

be the cell decomposition defined as above, which we call the standard decomposition of $\mathrm{S}^{n-i-1}$. The decomposition

$$
\mathrm{HD}\left(b_{\sigma}\right)=\cup \mathrm{D}(\tau)
$$

is equal to the standard product decomposition

$$
\{\mathrm{L} k(\sigma, \mathrm{M}) *(p t .)\} \times\left(\cup_{\alpha}^{\cup} \mathrm{C}_{\alpha}\right)
$$

All the cells of $\operatorname{HD}\left(b_{\sigma}\right)$ which is not contained in $\operatorname{LD}\left(b_{\sigma}\right) \cap \operatorname{HD}\left(b_{\sigma}\right)$ is written as

$$
(\mathrm{L} k(\sigma, \mathrm{M}) *(p t .)) \times \mathrm{C}_{\alpha}
$$

Finally we define $\mathrm{M}_{(i)}$ the subcomplex of M composed of handles whose indexes are inferior or equal to $i$, that is,

$$
\mathrm{M}_{(i)}=\underset{j \leqslant i}{\cup} \mathrm{M}_{j} \subset \mathrm{M}
$$

Then we have

$$
\mathrm{M}_{(i)}=\mathrm{M}_{(i-1)} \cup \mathrm{M}_{i}
$$

attached on $\cup_{\sigma} \mathrm{LD}\left(b_{\sigma}\right), \sigma$ being $(n-i)$-simplexes.

## 3. PL-homology spheres.

We call an $n$-dimensional homology manifold whose homology groups are isomorphic to those of $\mathrm{S}^{n}$ a homology $n$-sphere or homology sphere of dimension $n$. If it is a PL-manifold, it is called a PLhomology $n$-sphere.

If dimension is smaller than 3, a homology sphere is the natural sphere. And so any 3-dimensional homology manifold is a PL-manifold. In order to study higher dimensional cases we define the group $\mathcal{H e}^{3}$.

Let $X^{3}$ be the set of oriented 3-dimensional PL-homology spheres. Note that any homology sphere is orientable. We say that $H_{1}^{3} \in \mathrm{X}^{3}$ is equivalent to $\mathrm{H}_{2}^{3} \in \mathrm{X}^{3}$ if $\mathrm{H}_{1}^{3} \#\left(-\mathrm{H}_{2}^{3}\right)$ is the boundary of an acyclic PL-manifold, where $\#$ denotes the connected sum and
$-\mathrm{H}_{2}^{3}$ is $\mathrm{H}_{2}^{3}$ with the orientation inversed. Let $\mathscr{\not} \mathscr{B}^{3}=\mathrm{X}^{3} / \sim$ be the set of equivalence classes. By the connected sum operation, $\mathscr{H}^{3}$ is an abelian group. Let $G$ be the binary dodecahedral group. The quotient space $S^{3} / G$ is a PL-homology sphere whose class in $\mathcal{H}^{3}$ is non trivial.

On the contrary, for higher dimensions the following is known [2] [6] [4].

Proposition 1 (Hsiang-Hsiang, Tamura, Kervaire). - Any PLhomology sphere is the boundary of a contractible PL-manifold, if the dimension is greater than 3.

We will prove the followings, where $x$ is a point in $\mathrm{S}^{i}, i \geqslant 1$.
Proposition 2. - Let $\mathrm{H}^{3} \in \mathrm{X}^{3}$, then $\mathrm{H}^{3} \times \mathrm{S}^{1}$ is the boundary of a PL-manifold $\mathrm{K}^{5}$ such that $\mathrm{H}_{*}(\mathrm{~K}) \cong \mathrm{H}_{*}\left(\mathrm{~S}^{1}\right)$ and the inclusion

$$
j: \mathrm{S}^{1} \hookrightarrow\{x\} \times \mathrm{S}^{1} \hookrightarrow \mathrm{H}^{3} \times \mathrm{S}^{1} \hookrightarrow \mathrm{~K}
$$

induce an isomorphism of the fundamental groups.
Proposition 3. - Let $\mathrm{H}^{3} \in \mathrm{X}^{3}$ and let $i \geqslant 2$. Then $\mathrm{H}^{3} \times \mathrm{S}^{i}$ is the boundary of a PL-manifold $\mathrm{K}^{4+i}$ such that the inclusion

$$
j: \mathrm{S}^{i} \hookrightarrow\{x\} \times \mathrm{S}^{i} \hookrightarrow \mathrm{H}^{3} \times \mathrm{S}^{i} \hookrightarrow \mathrm{~K}
$$

induces a homotopy equivalence.

Proof of Proposition 2. - Since any orientable closed 3-dimensional PL-manifold is a boundary of a 4-dimensional parallelizable PL-manifold (See by example [3]), we have a parallelizable PLmanifold $L^{4}$ such that $\partial \mathrm{L}=\mathrm{H}$. By doing surgery we can assume that $\pi_{1}(\mathrm{~L})=0$. By the Poincaré duality theorem, $\mathrm{H}_{2}(\mathrm{~L})$ is free abelian. Let $p: \mathrm{L} \times \mathrm{S}^{1} \rightarrow \mathrm{~S}^{1}$ be the projection. Then it induces an isomorphism of the fundamental groups. Remark that if we have a manifold K with boundary $\mathrm{H}^{3} \times \mathrm{S}^{1}$ such that $\mathrm{H}_{2}(\mathrm{~K}) \cong 0$ and the inclusion $j: \mathrm{S}^{1} \hookrightarrow \mathrm{~K}$ induces the isomorphism of the fundamental groups, then, by the Poincaré duality, we have $\mathrm{H}_{i}(\mathrm{~K})=0$ for $i \geqslant 2$. Hence it is sufficient to kill $\mathrm{H}_{2}\left(\mathrm{~L} \times \mathrm{S}^{1}\right)$. Since $\mathrm{H}_{2}(\mathrm{~L})$ is free, so is $\mathrm{H}_{2}\left(\mathrm{~L} \times \mathrm{S}^{1}\right)$. We can follow the method of lemma 5.7 of Kervaire-Milnor [5]. Since $\pi_{1}(L)=0$, the Hurewicz map of $L, \pi_{2}(L) \rightarrow H_{2}(L)$, is isomorphic,
and so is the Hurewicz map of $L \times S^{1}$

$$
h: \pi_{2}\left(\mathrm{~L} \times \mathrm{S}^{1}\right) \rightarrow \mathrm{H}_{2}\left(\mathrm{~L} \times \mathrm{S}^{1}\right)
$$

Hence we can represent any element of $\mathrm{H}_{2}\left(\mathrm{~L} \times \mathrm{S}^{1}\right)$ by an embedded sphere. In our case the boundary $\partial\left(L \times S^{1}\right)$ is $H^{3} \times S^{1}$ and it does not satisfy the hypothesis of that lemma. But since we have

$$
\mathrm{H}_{2}\left(\partial\left(\mathrm{~L} \times \mathrm{S}^{1}\right)\right)=0
$$

the result is the same.
Proof of Proposition 3. - Let $\mathrm{K}^{5}$ be the 5-dimensional PLmanifold of proposition 2 . Attach K with $\mathrm{H}^{3} \times \mathrm{D}^{2}$ by the identity map on $\mathrm{H}^{3} \times \mathrm{S}^{1}$. The constructed manifold $\mathrm{W}^{5}$ is a simply connected PL-homology sphere, and by the generalized Poincaré conjecture, it is the natural sphere $S^{5}$. It shows that we can embed $H^{3}$ in $S^{5}$ with a trivial normal bundle. By composing with the natural embedding $\mathrm{S}^{5} \hookrightarrow \mathrm{~S}^{4+i}$, we have an embedding of $\mathrm{H}^{3}$ in $\mathrm{S}^{4+i}$ with the trivial normal bundle. The manifold N which is the complement of the open regular neighbourhood of $\mathrm{H}^{3}$ in $\mathrm{S}^{4+i}$ has $\mathrm{H}^{3} \times \mathrm{S}^{i}$ as the boundary and the inclusion $j: \mathrm{S}^{i} \hookrightarrow \mathrm{~N}$ induces an isomorphism of homology groups, hence homotopy equivalence, which completes the proof.

## 4. An obstruction to constructing PL-manifold.

Let Mi be a homology manifold of dimension greater than 4 . We assume that the boundary $\partial \mathrm{M}_{\mathrm{N}}$ is a PL-manifold if it is not empty. As in § 2 , it has the handle decomposition

$$
\mathrm{M}:=\mathrm{M}_{(n)}=\underset{0 \leqslant i \leqslant n}{\cup} \mathrm{M}_{i}
$$

which has also the canonical homology cell complex structure. We want to construct a PL-manifold with a pseudo homology cell complex structure which is cellularly equivalent to $M$. Since $M_{(3)}$ is a PLmanifold, a problem first arises when we attach handles of index 4.

Let $\sigma$ be an $(n-4)$-simplex in the interior of M. Then $L k(\sigma, \mathrm{M})$ is a 3-dimensional PL-homology sphere. Connecting $\sigma$ by a path from
a fixed base point of $M$, we can give the orientation for the neighbourhood of $\sigma$, and hence for $\operatorname{Lk}(\sigma, \mathrm{M})$.

Let $\operatorname{Lk}(\sigma, \mathrm{M})$ be the class in the group $\mathscr{H}^{3}$. To each $(n-4)$ simplex $\sigma$ of M , we define a function $\lambda(\mathrm{M}):\{(n-4)$-simplex $\} \rightarrow \mathscr{H}{ }^{3}$ by

$$
\lambda(\mathrm{M})(\sigma)= \begin{cases}\{\mathrm{L} k(\sigma, \mathrm{M})\} & \text { if } \quad \sigma \in \text { Int. } \mathrm{M} \\ 0 & \text { otherwise. }\end{cases}
$$

Then $\lambda(\mathrm{M})$ is an element of the chain group $\mathrm{C}_{n-4}\left(\mathrm{M}, \mathcal{H} \mathscr{P}^{3}\right)$. The coefficient may be twisted if the manifold is not orientable.

Lemma 1. - $\lambda(\mathrm{M})$ is a cycle.

Proof. - Let $\mu$ be an $(n-5)$-simplex. In the homology 4 -sphere $\mathrm{L} k(\mu)$, the complex $\cup \mathrm{L} k\left(\sigma_{i}\right) *\left(x_{i}\right)$, where $x_{i}$ denotes the barycenter of the 1 -simplex $b_{\mu} b_{\sigma_{i}}$ and the sum extends to all the $(n-4)$ simplexes such that $\sigma_{i}>\mu$, is a subcomplex whose complement in $L k(\mu)$ is a PL-manifold. So the connected-summed PL-manifold $\Sigma \operatorname{Lk}\left(\sigma_{i}\right)$ bounds an acyclic PL-manifold.

Hence $\lambda(M)$ represents an element $\{\lambda(M)\}$ of $H_{n-4}\left(M, \mathcal{H} e^{3}\right)$. Now we have the theorem :

Theorem. - Let $\mathrm{M}^{n}$ be a homology manifold with the dimension $n>4$. Assume that $\partial \mathrm{M}$ is a PL -manifold if $\partial \mathrm{M} \neq \emptyset$. If the obstruction class

$$
\{\lambda(\mathrm{M})\} \in \mathrm{H}_{n-4}\left(\mathrm{M}, \mathscr{H}^{3}\right)
$$

is zero, then there exists a PL-manifold N with a pseudo homology cell decomposition which is cellularly equivalent to M .

Proof. - Since $\{\lambda(M)\}=0$, there exists a correspondance

$$
g:\{(n-3) \text {-simplex }\} \rightarrow \mathcal{F} \mathbb{Z}^{3}
$$

such that

$$
\sum_{\tau_{i}>\sigma} g\left(\tau_{i}\right)=\{\mathrm{L} k(\sigma, \mathrm{M})\} \in \mathscr{H}^{3}
$$

We will inductively construct PL-manifolds $\mathrm{N}_{p}$ and $\mathrm{N}_{(p)}=\underset{q \leqslant p}{\bigcup_{q}} \mathrm{~N}_{q}$ with a pseudo homology cell decomposition $\mathrm{N}_{p}=\cup \mathrm{E}_{\alpha}$ where all
pseudo cells are PL-manifolds such that $\mathrm{N}_{(p)}$ is cellularly equivalent to $\mathrm{M}_{(p)}$.
(a) $p \leqslant 2$. In this case, the manifolds $\mathrm{N}_{p}, \mathrm{~N}_{(p)}$ and their cells are just equal to $\mathrm{M}_{p}, \mathrm{M}_{(p)}$ and their cells. That is, for any $j$-simplex $\sigma$, $j \geqslant n-2$, we define the PL-manifolds as

$$
\begin{gathered}
\mathrm{E}\left(b_{\sigma}\right)=\mathrm{D}\left(b_{\sigma}\right) \\
\mathrm{N}_{p}=\cup\left\{\mathrm{E}\left(b_{\sigma}\right) \mid \operatorname{dim} \sigma=n-p\right\}=\cup\left\{\mathrm{D}\left(b_{\sigma}\right) \mid \operatorname{dim} \sigma=n-p\right\}=\mathrm{M}_{p}
\end{gathered}
$$

For any simplex $\mu \in M^{\prime}$ such that $\mu>b_{\sigma}$, we put

$$
\mathrm{E}(\mu)=\mathrm{D}(\mu)
$$

Hence $\partial \mathrm{E}\left(b_{\sigma}\right)=\partial \mathrm{D}\left(b_{\sigma}\right)=\cup \mathrm{D}(\mu)=\cup \mathrm{E}(\mu)$, and $\mathrm{N}_{(p)}=\mathrm{M}_{(p)}$.
(b) $p=3$. Let $\tau_{i}$ be an $(n-3)$-simplex. Let $\mathrm{H}_{i}^{3}$ be the 3-dimensional PL-homology sphere which represents $g\left(\tau_{i}\right)$ and let $\mathrm{K}_{i}$ be the PL-manifold whose boundary is $\mathrm{H}_{i}^{3} \times \mathrm{S}^{n-4}$ such that the inclusion $j: \mathrm{S}^{n-4} \hookrightarrow \mathrm{~K}_{i}$ induces the isomorphisms of the fundamental groups and the homology groups, whose existence is shown by propositions 2 and 3 of $\S 3$. Let $\mathrm{D}^{3} \subset \mathrm{H}_{i}^{3}$ be a disc. Then $\mathrm{D}^{3} \times \mathrm{S}^{n-4} \subset \partial \mathrm{~K}_{i}$. We have the PL-homeomorphism $\partial \mathrm{D}\left(b_{\tau_{i}}\right)=\mathrm{S}^{2} \times \mathrm{D}^{n-3} \cup \mathrm{D}^{3} \times \mathrm{S}^{n-4}$. We define the PL-manifolds $\mathrm{E}\left(b_{\tau_{i}}\right)$ and $\mathrm{N}_{3}$ by

$$
\begin{aligned}
& \mathrm{E}\left(b_{\tau_{i}}\right)=\mathrm{D}\left(b_{\tau_{i}}\right) \underset{\mathrm{D}^{3} \times \mathrm{S}^{n-4}}{\cup} \mathrm{~K}_{i} \\
& \mathrm{~N}_{3}=\cup_{i} \mathrm{E}\left(b_{\tau_{i}}\right)
\end{aligned}
$$

where $\mathrm{D}\left(b_{\tau_{i}}\right)$ is attaced to $\mathrm{K}_{i}$ by the identity map on $\mathrm{D}^{3} \times \mathrm{S}^{n-4}$. It is easy to see that $\mathrm{E}\left(b_{\tau_{i}}\right)$ is a homology cell. We will give the pseudo cell decomposition for $\partial \mathrm{E}\left(b_{\tau_{i}}\right)$. First we devide $\partial \mathrm{E}\left(b_{\tau_{i}}\right)$ as the union $\partial \mathrm{E}\left(b_{\tau_{i}}\right)=\operatorname{LE}\left(b_{\tau_{i}}\right) \cup \operatorname{HE}\left(b_{\tau_{i}}\right)$, where

$$
\begin{aligned}
& \operatorname{LE}\left(b_{\tau_{i}}\right)=\partial \mathrm{D}\left(b_{\tau_{i}}\right)-\mathrm{D}^{3} \times \mathrm{D}^{n-3} \\
& \operatorname{HE}\left(b_{\tau_{i}}\right)=\partial \mathrm{K}_{i}-\mathrm{D}^{3} \times \mathrm{S}^{n-4}=\left(\mathrm{H}_{i}^{3}-\mathrm{D}^{3}\right) \times \mathrm{S}^{n-4}
\end{aligned}
$$

Since $\operatorname{LE}\left(b_{\tau_{i}}\right)=\operatorname{LD}\left(b_{\tau_{i}}\right)$, we give the cell decomposition by that of $\operatorname{LD}\left(b_{\tau_{i}}\right)$. We give the pseudo cell decomposition in the interior of $\operatorname{HE}\left(b_{\tau_{i}}\right)$ as

$$
\left(\mathrm{H}_{i}^{3}-\mathrm{D}^{3}\right) \times \mathrm{S}^{n-4}=\left(\mathrm{H}_{i}^{3}-\mathrm{D}^{3}\right) \times\left(\cup_{\alpha} \mathrm{C}_{\alpha}\right)=\cup_{\alpha}\left(\mathrm{H}_{i}^{3}-\mathrm{D}^{3}\right) \times \mathrm{C}_{\alpha}
$$

where $\mathrm{S}^{n-4}=\cup \mathrm{C}_{\alpha}$ is the standard decomposition. These decompositions of $\operatorname{LE}\left(b_{\tau_{i}}\right)$ and $\operatorname{HE}\left(b_{\tau_{i}}\right)$ fit together on their intersection and give the decomposition of $\partial \mathrm{E}\left(b_{\tau_{i}}\right)$, which is clearly cellular equivalent to that of $\partial \mathrm{D}\left(b_{\tau_{i}}\right)$. For each simplex $\mu>b_{\tau_{i}}, \mu \in \mathrm{M}^{\prime}$, we denote by $\mathrm{E}(\mu)$ the pseudo cell of $\partial \mathrm{E}\left(b_{\tau_{i}}\right)$ which corresponds by the equivalence to $\mathrm{D}(\mu) \in \partial \mathrm{D}\left(b_{\tau_{i}}\right)$. We have $\partial \mathrm{E}\left(b_{\tau_{i}}\right)=\cup \mathrm{E}(\mu)$. We define $\mathrm{N}_{(3)}$ by

$$
N_{(3)}=N_{(2)} \cup N_{3}
$$

attached by the identity on $\operatorname{LE}\left(b_{\tau_{i}}\right) . \mathrm{N}_{(3)}$ is cellularly equivalent to $M_{(3)}$.
(c) $p=4$. Let $\sigma$ be a $(n-4)$-simplex. Let $\cup \mathrm{E}(\mu) \subset \partial \mathrm{N}_{(3)}$ be the union of pseudo cells such that $b_{\sigma}<\mu \in \mathrm{M}^{\prime}, \mu \neq b_{\sigma}$. Then by the definition, it is PL-homeomorphic to the PL-manifold

$$
\left(\mathrm{L} k(\sigma) \# \Sigma\left(-\mathrm{H}_{i}^{3}\right)\right) \times \mathrm{D}^{n-4}
$$

where $\mathrm{H}_{i}^{3}$ represents $g\left(\tau_{i}\right)$ and the sum extends to all $\tau_{i}>\sigma$.
Since $\{\operatorname{Lk}(\sigma)\}=\Sigma g\left(\tau_{i}\right)$ in $\mathcal{H e}^{3}$, the PL-homology 3-sphere

$$
\mathrm{H}_{\sigma}^{3}=\mathrm{L} k(\sigma) \# \Sigma\left(-\mathrm{H}_{i}^{3}\right)
$$

is the boundary of an acyclic PL-manifold $\mathrm{W}_{\sigma}^{4}$. The union

$$
\mathrm{W}_{\sigma}^{4} \times \mathrm{S}^{n-5} \cup \mathrm{H}_{\sigma}^{3} \times \mathrm{D}^{n-4}
$$

is a PL-homology $(n-1)$-sphere. By the proposition 1 of $\S 3$, it is the boundary of a contractible PL-manifold $\mathrm{Y}_{\sigma}$. We define the PLmanifolds $\mathrm{E}\left(b_{\sigma}\right)$ and $\mathrm{N}_{4}$ as

$$
\begin{aligned}
& \mathrm{E}\left(b_{\sigma}\right)=\mathrm{Y}_{\sigma} \\
& \mathrm{N}_{4}=\cup \mathrm{E}\left(b_{\sigma}\right) .
\end{aligned}
$$

Further we define $\operatorname{LE}\left(b_{\sigma}\right)$ and $\operatorname{HE}\left(b_{\sigma}\right)$ by

$$
\begin{aligned}
& \operatorname{LE}\left(b_{\sigma}\right)=\mathrm{H}_{\sigma}^{3} \times \mathrm{D}^{n-4} \\
& \operatorname{HE}\left(b_{\sigma}\right)=\mathrm{W}_{\sigma}^{4} \times \mathrm{S}^{n-5}
\end{aligned}
$$

The pseudo cellular decomposition for $\operatorname{LE}\left(b_{\sigma}\right)$ is already defined and we give for $\operatorname{HE}\left(b_{\sigma}\right)$ by the product with the standard decomposition
of $S^{n-5}$. They give a pseudo cellular decomposition of

$$
\partial \mathrm{E}\left(b_{\sigma}\right)=\mathrm{LE}\left(b_{\sigma}\right) \cup \mathrm{HE}\left(b_{\sigma}\right)
$$

which is cellularly equivalent to that of $\partial \mathrm{D}\left(b_{\sigma}\right)$. For each simplex $\mu>b_{\sigma}, \mu \in \mathrm{M}^{\prime}$, we define $\mathrm{E}(\mu)$ by the pseudo cell which corresponds to $D(\mu)$ by this equivalence. We define $N_{(4)}$ by $N_{(3)} \cup N_{4}$ attached by the identity of $\operatorname{LE}\left(b_{\sigma}\right)$, which is cellularly equivalent to $\mathrm{M}_{(4)}$.
(d) $p \geqslant 5$. Let $\sigma$ be a $j$-simplex $j \leqslant n-5$. Let $\cup \mathrm{E}(\mu) \subset \partial \mathrm{N}_{(n-j-1)}$ be the union of pseudo cells such that $\mu>b_{\sigma}, \mu \neq b_{\sigma}$. Then by our definition, it is a PL-manifold

$$
\mathrm{H}_{\sigma}^{p-1} \times \mathrm{D}^{n-p}
$$

where $\mathrm{H}_{\sigma}^{p-1}$ is a PL-homology $(p-1)$-sphere, where $p=n-j$. By the proposition 1 of $\S 3, \mathrm{H}^{p-1}$ is the boundary of a contractible PLmanifold $\mathrm{W}_{\sigma}^{p}$. We define $\mathrm{E}\left(b_{\sigma}\right)$ by

$$
\mathrm{E}\left(b_{\sigma}\right)=\mathrm{W}_{\sigma}^{p} \times \mathrm{D}^{n-p}
$$

The other definitions are just similar to the case when $p=4$.
Continuing this process, we obtain a PL-manifold $\mathrm{N}=\mathrm{N}_{(n)}$ which is cellularly equivalent to $\mathrm{M}=\mathrm{M}_{(n)}$.
Q.E.D.

## 5. Simple homotopy equivalence.

By the theorem of $\S 4$, for the same $M$, if the obstruction class is 0 , we can construct a PL-manifold N . In this section, we prove the following.

ThEOREM. - If M is compact, the constructed manifold N is simple homotopy equivalent to M .

Let $\mathrm{M}^{(k)}$ denote the $k$-skelton of M . Let L be a subcomplex of $\mathrm{M}^{(k)}$, we define the PL-submanifold $\mathrm{N}^{(\mathrm{L})}$ of N by

$$
\mathrm{N}^{(\mathrm{L})}=\cup\left\{\mathrm{E}\left(b_{\sigma}\right) \mid \sigma \in \mathrm{L}\right\}
$$

We put

$$
\mathrm{N}^{(k)}=\mathrm{N}^{\left(\mathrm{M}^{(k)}\right)}=\cup\left\{\mathrm{E}(b) \mid \sigma \in \mathrm{M}^{(k)}\right\}
$$

By the induction of $k$, we prove the stronger

Lemma 1. - There exists a simple homotopy equivalence

$$
f: \mathrm{M}^{(k)} \rightarrow \mathrm{N}^{(k)}
$$

such that, for any $(k+1)$-simplex $\mu, f(\partial \mu) \subset \mathrm{N}^{(\partial \mu)}$ and

$$
f / \partial \mu: \partial \mu \rightarrow \mathrm{N}^{(\partial \mu)}
$$

is a simple homotopy equivalence.

Proof. - If $k=0$, it holds obviously. Now we will prove the lemma for $k+1$ assuming the lemma for $k$. Let $\mu$ be a $(k+1)$ simplex. Since the collar of $\partial \mu$ is PL-homeomorphic to $\mathrm{S}^{k} \times \mathrm{I}$, we can write

$$
\mu=\mathrm{S}^{k} \times \mathrm{I} \cup \mathrm{~S}^{k} *\left(b_{\mu}\right)
$$

where $\mathrm{S}_{0}^{k}=\mathrm{S}^{k} \times\{0\}=\partial \mu$ and $\mathrm{S}_{1}^{k}=\mathrm{S}^{k} \times\{1\}=\mathrm{S}^{k} \times \mathrm{I} \cap \mathrm{S}^{k} *\left(b_{\mu}\right)$. Recall that

$$
\begin{aligned}
& \mathrm{N}^{\left(\mathrm{M}^{(k)} \cup \mu\right)}=\mathrm{N}^{(k)} \cup \mathrm{E}\left(b_{\mu}\right) \\
& \mathrm{N}^{(k)} \cap \mathrm{E}\left(b_{\mu}\right)=\mathrm{N}^{(\partial \mu)} \cap \mathrm{E}\left(b_{\mu}\right)=\mathrm{HE}\left(b_{\mu}\right)=\mathrm{W}_{\mu}^{n-k-1} \times \mathrm{S}^{k}
\end{aligned}
$$

where $\mathrm{W}_{\mu}^{n-k-1}$ is an acyclic (or contractible) PL-manifold. Let $x$ be a point in the interior of $\mathrm{W}_{\mu}$ and let $d: \mathrm{S}^{k} \rightarrow \mathrm{~W}_{\mu} \times \mathrm{S}^{k}$ be the embedding defined by $d\left(S^{k}\right)=\{x\} \times S^{k}$. We define a map

$$
\widetilde{f}: \mathrm{S}_{0}^{k} \cup \mathrm{~S}_{1}^{k} \rightarrow \mathrm{~N}^{(k)}
$$

by

$$
\begin{aligned}
& \widetilde{f} \mid S_{0}^{k}=f \\
& \widetilde{f} \mid S_{1}^{k}=d
\end{aligned}
$$

Since $\tilde{f} \mid \partial \mathrm{M}$ gives a simple homotopy equivalence $\partial \mu \rightarrow \mathrm{N}^{(\partial \mu)}, \mathrm{N}^{(\partial \mu)}$ is homotopy equivalent to $\mathrm{S}^{k}$, and so $\widetilde{f} \mid \mathrm{S}_{0}^{k}$ and $\widetilde{f} \mid \mathrm{S}_{1}^{k}$ are homotopic. Hence we can extend $\widetilde{f}$ on $\mathrm{S}^{k} \times \mathrm{I}$. Further since $\mathrm{E}\left(b_{\mu}\right)$ is contractible, we can extend $\widetilde{f}$ to a map from $\mu=\mathrm{S}^{k} \times \mathrm{I} \cup \mathrm{S}^{k} *\left(b_{\mu}\right)$ to $\mathrm{N}^{\left(\mathrm{m}^{(k)} \cup \mu\right)}$. By the definition, $f$ and $\widetilde{f}$ coincide on $\partial \mu$, and so we have a map

$$
g=f \cup \widetilde{f}: \mathrm{M}^{(k)} \cup \mu \rightarrow \mathrm{N}^{\left(\mathrm{M}^{(k)} \cup \mu\right)}
$$

Repeating this for all $(k+1)$-simplexes of M , we obtain a map $g: \mathrm{M}^{(k+1)} \rightarrow \mathrm{N}^{(k+1)}$. We have the exact sequences of chain groups,

$$
\begin{gathered}
0 \rightarrow \mathrm{C}_{*}\left(\mathrm{M}^{(k)}\right) \rightarrow \mathrm{C}_{*}\left(\mathrm{M}^{(k+1)}\right) \rightarrow \Sigma \mathrm{C}_{*}(\mu / \partial \mu) \rightarrow 0 \\
0 \rightarrow \mathrm{C}_{*}\left(\mathrm{~N}^{(k)}\right) \rightarrow \mathrm{C}_{*}\left(\mathrm{~N}^{(k+1)}\right) \rightarrow \Sigma \mathrm{C}_{*}\left(\mathrm{E}\left(b_{\mu}\right) / \operatorname{HE}\left(b_{\mu}\right)\right) \rightarrow 0
\end{gathered}
$$

where we regard them as $\mathrm{Z} \pi_{1}\left(\mathrm{M}^{(k+1)}\right)=\mathrm{Z} \pi_{1}\left(\mathrm{~N}^{(k+1)}\right)$-modules.

The map $g$ induces $f_{*}$ on the first elements and id.* on the third elements. Since they are chain equivalences with trivial Whitehead torsion, so is $g_{*}$ by [8]. Hence $g$ is a simple homotopy equivalence. It is easy to see that, for any $(k+2)$-simplex $\tau, g$ induce a simple homotopy equivalence

$$
g \mid \partial \tau: \partial \tau \rightarrow \mathrm{N}^{(\partial \tau)}
$$
