## Numdam

On the renresentations of reductive groups with disconnected centre

## G. Lusztig ${ }^{\star}$

1. We consider a connected reductive algebraic group defined over a finite field $\mathbb{F}_{q}$ with Frobenius map $F: G \rightarrow G$.
Let $\hat{G}^{F}$ denote the set of irreducible representations up to isomorphism of the finite group ${ }_{G}{ }^{F}$ over $\bar{Q}_{\ell}$ ( $\ell$ is a prime not dividing $q$ ). In the case where the centre $Z_{G}$ of $G$ is connected, a parametrization for $\hat{G}^{F}$ was given in [4] ; this is extended here to the general case (i.e. we allow $Z_{G}$ to be disconnected). The proof will be by a reduction to the case where $Z_{G}$ is connected using a method in [4, 14.1]. The results of this paper were obtained during the summer of 1983 and were announced in [5].
2. We denote by $G^{\star}$ a connected reductive group defined over $\mathbb{F}_{q}$, dual to $G$, as in [2 ]. We again denote by $F$ the corresponding Frobenius map. (The same notation will be used for the Frobenius map of any algebraic variety defined over $\mathbb{F}_{q}$ ). As in $[2]$ we have a natural bijection

$$
\left\{\left(T^{\prime}, \theta\right)\right\} \bmod G^{F} \text {-conjugacy } \leftrightarrow\{(T, s)\} \bmod G^{\star} F_{\text {-conjugacy }}
$$

where $T^{\prime}$ (resp.T) runs over the F-stable maximal torus of $G$ (resp. ${ }^{\star}$ ), $\theta: T^{\prime F} \rightarrow \bar{\Phi}_{\ell}^{\star}$ is a character and $s$ is an element of $T^{F}$. If ( $\left.T^{\prime}, \theta\right),(T, s)$ correspond in this way we consider the virtual representation $R_{T}^{G}$, $\theta$ ) defined in [2|; we shall also write $R_{T}^{G}(s)$ instead of $R_{T} \mathrm{G}^{\prime}(\theta)$.

For a semisimple element $s \in G^{\star F}$, let $\left(\hat{G}^{F}\right)_{S}$ be the set of all $\rho \in \hat{G}^{F}$ appearing with non-zero multiplicity in $R_{T}^{G}(s)$ for some F-stable maximal torus $T \subset G$.

The subset $\left(\widehat{G}^{F}\right)_{s}$ of $\widehat{\mathrm{G}}^{\mathrm{F}}$ depends only on the $\mathrm{G}^{\star}{ }^{\text {- }}$-conjugacy class of s . We

## G. LUSZTIG

have a partition $\hat{\mathrm{G}}^{F}=\frac{1 \mid}{\mathrm{S}}\left(\hat{\mathrm{G}}^{F}\right)_{S}$ where s runs over the semisimple elements of $\mathrm{G}^{\star} \mathrm{F}^{\text {up to }} \mathrm{G}^{\star \mathrm{F}}$-conjugacy. (See [2], [3]).
3. Let $\pi: G \rightarrow G_{a d}$ be the adjoint quotient of $G$. We have a natural isomorphism

$$
\mathrm{G}_{\mathrm{ad}}^{\mathrm{F}} / \pi\left(\mathrm{G}^{\mathrm{F}}\right) \cong\left(\mathrm{Z}_{\mathrm{G}} / \mathrm{z}_{\mathrm{G}}^{\mathrm{O}}\right)_{\mathrm{F}}
$$

(the subscript $F$ denotes $F$-coinvariants, i.e. largest quotient on which $F$ acts trivially ) ; it is defined by the correspondence $G_{a d}^{F} \supset g \rightarrow \dot{g}^{-1} F(\dot{g}) \in Z_{G}$, where $\dot{\mathrm{g}} \in \mathrm{G}$ satisfies $\pi(\dot{\mathrm{g}})=\mathrm{g}$.

The group $G_{\text {ad }}^{F}$ acts naturally on $G^{F}$ by autamornhisms $g: g_{1} \rightarrow \dot{\operatorname{gg}} g_{1} \dot{g}^{-1}$ ( $\mathrm{g}, \dot{\mathrm{g}}$ as above). Hence $\mathrm{G}_{\mathrm{F}}^{\mathrm{F}}$ acts naturally on $\overline{\mathrm{G}}^{\mathrm{F}}$. Clearly this action is trivial on the subgroup $\pi\left(G^{F}\right)$ hence it induces an action of $G_{a d}^{F} / \pi\left(G^{F}\right)$ on $\bar{G}^{F}$. It is easy to check that this action (extended by linearity to virtual representations) leaves fixed each $R_{T}^{G}(s)$; hence it leaves stable each subset $\left(\hat{G}^{F}\right){ }_{s}$ of $\hat{G}^{F}$. We have thus defined an action of $\left(z_{G} / z_{G}^{O}\right)_{F}$ on $\left({ }_{(G}^{F}\right)_{S}$.
4. We fix a semisimple element $s \in G^{\star}$ and we denote $H=Z_{G^{\star}}(s)$. If $x \in H^{F}$, then conjugation by $x$ is an automorphism of $H^{\circ}$ (over $\mathbb{F}_{\mathrm{q}}$ ) ; hence it defines an automorphism of $\hat{H}^{\circ \mathrm{F}}$ which leaves stable the set ( $\left.\hat{\mathrm{H}}^{\mathrm{OF}}\right)_{1}$ of unipotent representations. If $\mathrm{x} \in \mathrm{H}^{\mathrm{OF}}$, the corresponding automorphism of ( $\left.\hat{H}^{\circ \mathrm{F}}\right)_{1}$ is trivial, so we have a natural action of $\mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\circ \mathrm{F}}$ on ( $\left.\hat{\mathrm{H}}^{\mathrm{OF}}\right)_{1}$.
5. With these notations, we can now state our main result.

Proposition 5.1. There exists a surjective map
$\psi:\left(\hat{\mathrm{G}}^{\mathrm{F}}\right)_{\mathrm{S}} \rightarrow\left(\hat{\mathrm{H}}^{\circ \mathrm{F}}\right)_{1}$ mod action of $\mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}}$ with the following properties.
The fibres of $\psi$ are precisely the orbits of the action of $\left(Z_{G} / Z_{G}^{O}\right)_{F}$ on $\left(\hat{G}^{F}\right)_{S}$, (see Sec.3). If $\theta$ is a $H^{F} / H^{\circ F}$-orbit on $\left(\hat{H}^{\circ}\right)_{1}$ and $\Gamma$ is the stabilizer in $H^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}}$ of an element in $\theta$, then the fibre $\psi^{-1}(\theta)$ has precisely $|\Gamma|$ elements. If $\rho \in \psi^{-1}(\Theta)$ and $T$ is an $F$-stable maximal torus of $\mathrm{G}^{\star}$ containing s , then

$$
\left(\rho: R_{T}^{G}(s)\right){ }_{G} F=\varepsilon_{G} \varepsilon_{H}{\underset{\rho}{\rho} \in \Theta}^{\Sigma}\left(\bar{\rho}: R_{T}^{H^{\circ}}(1)\right){ }_{H}{ }_{\mathrm{OF}} .
$$

Here (: ) denotes the standard inner product of virtual representations and $\varepsilon_{G}=(-1)^{\sigma(G)}, \sigma(G)=\mathbb{F}_{\mathrm{Q}}$-rank of $G$; in $\mathrm{R}_{\mathrm{T}}^{\mathrm{H}^{\mathrm{O}}}(1), 1$ stands for the trivial character of $\mathrm{T}^{\mathrm{F}}$.

Remarks. The sets $\left(\hat{H}^{\circ F}\right)_{1}$ are described explicitly in [4] ; they are insensitive to the centre of $\mathrm{H}^{\circ}$. The action of outer automorphisms on the set of unipotent representations of a connected reductive group is easy to describe ; for example when that group is simple modulo its centre, of type $\neq D_{2 n}$, this action is trivial. The multiplicities $\left(\bar{\rho}: R_{T}^{H}(1)\right){ }_{H}{ }^{\mathrm{F}}$ are also described explicitly in [4]. Hence the proposition gives an explicit parametrization of $\left(\hat{G}^{F}\right)_{s}$ and explicit formulas for the multiplicities $\left(\rho: R_{T}^{G}(s)\right){ }_{G}{ }^{F}$.
6. Now let $G^{\prime}$ be a connected reductive group over $\mathbb{F}_{q}$ with connected centre. Let $s^{\prime} \in C^{\prime \star} F$ be semisimple and let $H^{\prime}=Z_{G^{\prime \star}}\left(s^{\prime}\right)$. Then both groups $\left(Z_{\mathrm{G}}, / Z_{G^{\prime}}^{\circ}\right)_{F}$ and $H^{\prime} F_{H}$ 'OF are trivial and from 5.1 we obtain the following known result.

Corollary 6.1. [4]. If $Z_{G}$ is connected, then there exists a bijection $\psi:\left(\hat{G}^{\prime F}\right)_{S^{\prime}} \longrightarrow\left(\hat{H}^{\prime O F}\right)_{1}$ such that $\left(\rho^{\prime}: R_{T^{\prime}}{ }^{\prime}\left(s^{\prime}\right)\right)_{G^{\prime}} F=\varepsilon_{G^{\prime}} \varepsilon_{H^{\prime}}\left(\bar{\rho}^{\prime}: R_{T^{\prime}}^{H^{\prime O}}(1)\right){ }_{H^{\prime}} O F$ for any $\rho^{\prime} \in\left(\hat{G}^{\prime F}\right)_{S^{\prime}}$ and any F-stable maximal torus $T^{\prime}$ of $G^{\prime}$ containing $s^{\prime}$; here $\bar{\rho}=\psi(\rho)$.
7. If $G$ is as in Sec. 1, we say that $i$ : $G \rightarrow G^{\prime}$ is a regular imbedding if $G^{\prime}$ is a connected reductive group over $\mathbb{F}_{q}$ with connected centre, $i$ is an isomorphism of $G$ with a closed subgroup of $G^{\prime}$ and $i(G), G^{\prime}$ have the same derived subgroup.

We shall need the following simple result.
Lemma 7.1. [1, 2.3.2]. If $G$ is semisimple and $i: G \rightarrow G^{\prime}, \bar{i}: G \rightarrow \bar{G}$ are regular imbeddings, then there exists a connected reductive group $G$ " over $\mathbb{F}_{\mathrm{q}}$ and regular imbeddings $j: G^{\prime} \rightarrow G^{\prime \prime}, \bar{j}: \bar{G} \rightarrow G^{\prime \prime}$ such that $j \circ i=\bar{j} \circ \bar{i}$.
8. With $G$ as in Sec. l, we fix a regular imbedding $G \rightarrow G^{\prime}$. To this corresponds by duality a surjective homomorphism $\delta: G^{\prime \star} \rightarrow G^{\star}$ (over $\mathbb{F}_{q}$ ) whose kernel $K$ is a central torus in $G^{\prime *}$. We have a natural isomorphism $K^{F} \longrightarrow \operatorname{Hom}\left(G^{\prime}{ }^{F} / G^{F}, \bar{\Phi}_{\ell}^{\star}\right), k \rightarrow \theta_{k}$. We consider the action of $K^{F}$ on $\hat{G}^{\prime}{ }^{F}$ given by $k: \rho^{\prime} \rightarrow \rho^{\prime} \otimes \theta_{k}$. The action of $k \in K^{F}$ on $\hat{G}^{F}$ defines a bijection $\left(\hat{\mathrm{G}}, \mathrm{F}_{\mathrm{S}_{1}} \xrightarrow{\sim}\left(\hat{\mathrm{G}}^{\prime} \mathrm{F}^{( }\right)_{\mathrm{ks}_{1}}\right.$ for any semisimple $\mathrm{s}_{1} \in \mathrm{G}^{\star \star \mathrm{F}}$.

Now let $s^{\prime} \in G^{\prime \star^{F}}$ be semisimple, $H^{\prime}=Z_{G^{\prime}{ }^{\star}}\left(s^{\prime}\right)$. Let $K_{S^{\prime}}^{F}$, be the set of all $k \in K^{F}$ which map $\left(\hat{G}^{\prime}{ }^{F}\right)_{S}$, into itself or, equivalently,

$$
K_{s^{\prime}}^{F}=\left\{k \in K^{F} \mid k s^{\prime} \quad \text { is conjugate to } s^{\prime} \text { under } G^{\prime}{ }^{\star} F\right\}
$$

If $s=\delta\left(s^{\prime}\right) \in G^{\star} F$, and $H=Z_{G^{\star}}(s)$ we have a natural isomorphism $H^{F} / H^{\circ F}=K^{F} S^{\prime}$ defined by the correspondence $\quad{ }_{H}{ }^{F} \supset x \rightarrow S^{\prime-1} \dot{x}^{\prime} \dot{x}^{-1} \in K^{F}$ where $\dot{x} \in G^{\prime}{ }^{\star} F$ satisfies $\delta(\dot{x})=x$. (Note that $\delta: G^{\prime{ }^{\star} F} \rightarrow G^{\star F}$ is surjective). Using this isomorphisum the action of $K_{S}^{F}$, on $\left(\hat{G}^{\prime F}\right)_{S}$, becomes an action of $H^{F} / H^{\circ F}$ on ( $\left.\hat{G}^{\prime}{ }^{F}\right)_{S}$, Now $\delta$ defines a surjective homomorphism $\mathrm{H}^{\circ}{ }^{\circ} \rightarrow \mathrm{H}^{\circ}$ with kernel K , hence a bijection $\left(\hat{\mathrm{H}}^{\mathrm{OF}}\right)_{1} \xrightarrow{\sim}\left(\hat{\mathrm{H}}^{\mathrm{OFF}}\right)_{1}$. Using this, the action of $\mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}}$ on $\left(\hat{\mathrm{H}}^{\mathrm{OF}}\right)_{1}$ in $\sec 4$ becomes an action on ( $\left.\overline{\mathrm{H}},{ }^{\circ F}\right)_{1}$. We shall need the following strengthening of 6.1. Proposition 8.1. The isomorphism $\psi$ in 6.1 can be chosen to be compatible with the action of $\mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}}$ on $(\hat{\mathrm{G}}, \mathrm{F})_{\mathrm{S}}$, and $\left(\hat{\mathrm{H}}^{,} \mathrm{OF}\right)_{1}$ defined above.

Proof. (a) Assume first that $G$ is almost simple, simply connected. If $G$ is a classical group, then $\psi$ in 6.1 is uniquely determined ; in the remaining cases (with one exception) either $H$ is connected (and there is nothing to prove) or $\psi$ is uniquely determined. In these cases the result follows easily. The exception is : $G$ of type $E_{7}, s \in G^{\star F}$ is such that $H=Z_{G^{\star}}$ (s) has two components and $H^{\circ}$ modulo its centre is of type $E_{6}$. There are two representations in ( $\hat{G}^{\prime}{ }^{F}$ ) $s^{\prime}$ which are not distinguished by their multiplicities in the $\mathrm{R}_{\mathrm{T}} \mathrm{G}^{\prime}\left(\mathrm{s}^{\prime}\right)$. We must show that they are in the same orbit of $H / H^{\mathrm{OF}} \cong \mathbb{Z} / 2$. If they are not, they would remain irreducible on restriction to $\mathrm{G}^{\mathrm{F}}$. But their restrictions to $\mathrm{G}^{\mathrm{F}}$ are reducible by an argument in [4, p.353].
(b) Assume next that $G=G_{1} \times G_{2} \times \ldots \times G_{n}$ with almost simple,
simply connected factors $G_{i}$ permuted by $F$ and that $G^{\prime}=G_{1}^{\prime} \times G_{2}^{\prime} \times \ldots \times G_{n}^{\prime}$ where $G_{i} \rightarrow G_{i}^{\prime}$ are regular imbeddings over an extension of $\mathbb{F}_{q}$ and the $G_{i}$ are again permuted by $F$. In this case we group together the factors in the various orbits of $F$ and we are reduced to the case where $F$ permutes cyclically the indices. In that case we have $\mathcal{E}^{F}=G_{1} F^{n}, G^{\prime}{ }^{F}=G^{\prime} F^{n}$ and the result follows by applying (a) to $G_{1}$ and $G_{1}^{\prime}$ instead of $G$ and $G$ '.
(c) Assume that $G$ is simply connected. We decompose $G$ in a product $\mathrm{G}_{1} \times \mathrm{G}_{2} \times \ldots \times \mathrm{G}_{\mathrm{n}}$ as in (b) ; we imbed it in $\overline{\mathrm{G}}=\overline{\mathrm{G}}_{1} \times \ldots \times \overline{\mathrm{G}}_{\mathrm{n}}$ where $\mathrm{G} \rightarrow \overline{\mathrm{G}}$ is like $G \rightarrow G^{\prime}$ in (b). Let $G^{\prime} \rightarrow G^{\prime \prime}, \bar{G} \rightarrow G^{\prime \prime}$ be as in 7.1. We can find $s^{\prime \prime} \in G^{\prime \prime}{ }^{\star} F$ which maps to $s^{\prime} \in G^{\prime}{ }^{\star} F$ and to some element $\bar{s} \in \bar{G}^{\star} F$ under $G^{\prime \star} \leftarrow G^{\prime \prime} \rightarrow \bar{G}^{\star}$. Since $G^{\prime}, G^{\prime \prime}, \bar{G}$ have connected centre, we get by restriction bijections
 Since the case ( $G \rightarrow \bar{G}, \bar{s}$ ) is handled by (b), the cases ( $G \rightarrow G^{\prime \prime}, s^{\prime \prime}$ ) and ( $G \rightarrow G^{\prime}, s^{\prime}$ ) follow.
(d) Assume that $G$ is the derived group of $G$ '. We can find a connected reductive group $\widetilde{G}^{\prime}$ over $\mathbb{F}_{q}$ with simply connected derived group $\widetilde{G}$ and a surjective homomoprhism $\widetilde{G}^{\prime} \rightarrow G^{\prime} \quad\left(\right.$ over $\mathbb{F}_{q}$ ) whose kernel is a central torus in $\widetilde{G}^{\prime}$. Then $\widetilde{G}^{\prime}$ has connected centre and $\widetilde{G}^{\prime} \rightarrow G^{\prime}$ restricts to a finite covering $\widetilde{G} \rightarrow G$. We have $G^{\prime \star} \subset \widetilde{G}^{\prime \star}$ hence $s^{\prime}$ can be considered as an element of $\widetilde{G}^{\prime \star} F$. Let $\tilde{s}$ be the image of $s \in G^{\star} F$ under the finite covering $G^{\star} \rightarrow \widetilde{G}^{\star}$. Let $\widetilde{H}=Z_{\mathcal{G}^{\star}}(\widetilde{s})$. We have a natural imbedding $\mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}} \rightarrow \widetilde{\mathrm{H}} / \widetilde{\mathrm{H}}^{\mathrm{OF}}$, induced by $\mathrm{G}^{\star} \rightarrow \widetilde{\mathrm{G}}^{\star}$. Composition with $\widetilde{G}^{\prime}{ }^{F} \rightarrow G^{\prime}{ }^{F}$ defines a bijection $\left(\hat{G}^{\prime F}\right)_{S^{\prime}} \xrightarrow{\sim}\left(\tilde{\mathcal{G}}^{\prime}\right)_{S^{\prime}}$. Applying (c) to $\left(\widetilde{G} \rightarrow \tilde{G}^{\prime}, s^{\prime}\right)$ we deduce the desired result for $\left(G \rightarrow G^{\prime}, s^{\prime}\right)$.
(e) We now consider the general case. Let $G$ " be the derived group of $G$. Let $s^{\prime \prime}$ be the image of $s \in G^{\star F}$ under $G^{\star} \rightarrow G^{\prime \prime \star}$ and let $H^{\prime \prime}=Z_{G^{\prime \prime}}\left(s^{\prime \prime}\right)$. We have a natural imbedding $H^{F} / \mathrm{H}^{\circ \mathrm{F}} \rightarrow \mathrm{H}^{\mathrm{FF}} / \mathrm{H}^{\mathrm{OF}}$. Applying (d) to ( $\mathrm{G}^{\prime \prime} \rightarrow \mathrm{G}^{\prime}, \mathrm{s}^{\prime}$ ) we deduce the desired result for $\left(G \rightarrow G^{\prime}, s^{\prime}\right)$. This completes the proof.
9. Let $A \subset B$ be finite groups such that $A$ is normal in $B$ and $B / A$ is abelian. Then the abelian group $B / A$ acts naturally on $\hat{A}$ (this is induced by the action of $B$ on $A$ by conjugation) and the abelian aroup $\overline{B / A}$ acts naturally

## G. LUSZTIG

on $\hat{B}$ by tensor product. The proofs of the results in this section are standard, and will be onmitted.
(a) Assume that any $\rho \in \hat{B}$ restricts to a multiplicity free representation of $A$. Then there is a unique bijection

$$
\hat{\mathrm{A}} \text { mod action of } \mathrm{B} / \mathrm{A} \leftrightarrow \hat{\mathrm{~B}} \text { mod action of } \mathrm{B} / \mathrm{A}
$$

with the following properties. Let $\theta$ be a $B / A$-orbit on $\hat{A}$ and let $\theta^{\prime}$ be the corresponding $\hat{B / A}$-orbit on $\hat{B}$. Then if $\rho_{0} \in \theta^{\prime}$, we have $\rho_{0} \mid A=\sum_{\tau \in \Theta} \tau ;$ if $\tau_{0} \in \theta$, we have $\operatorname{ind}_{A}^{B} \tau_{0}=\sum_{\rho \in \theta}$, $\rho$. Moreover, the stabilizer of $\rho_{0}$ in $^{\tau \epsilon \theta} \hat{B / A}$ and the stabilizer of $\tau_{0}$ in $B / A$ are orthogonal to each other under the natural duality $B / A \times B / A \rightarrow \overline{\mathbb{Q}}_{\ell}^{\star}$.

We now want to find conditions which should imply that the assumptions of (a) holds.
(b) If $B / A$ is cyclic then the assumption of (a) is automatically satisfied.
(c) Assume now that any $\rho \in \hat{B}$ has stabilizer $I_{\rho}$ in $\hat{B / A}$ isomorphic to $\mathbb{Z} / 2 \mathbb{Z} \times \mathbb{Z} / 2 \mathbb{Z}$ or $\mathbf{Z} / 2 \mathbb{Z}$ or $\{e\}$. Let $\hat{B}^{\prime}=\{\rho \in \hat{B}|\rho| A$ is multiplicity free $\}$, $\hat{B}^{\prime \prime}=\hat{B}-\hat{B}^{\prime}, \hat{A}^{\prime}=\{\tau \in \hat{A} \mid \tau$ appears in $\rho \mid A$ some $\rho \in \hat{B}\}, \hat{A}^{\prime \prime}=\hat{A}-\hat{A}^{\prime}$. Then the conclusions of (a) hold if $\hat{A}, \hat{B}$ are replaced by $\hat{A}^{\prime}, \hat{B}^{\prime}$. If $\rho \in \hat{B}^{\prime \prime}$ then $I_{\rho}=\mathbb{Z} / \mathbb{Z} \mathbb{Z} \times \mathbb{Z} / \mathbb{Z}$ and $\rho \mid A=2 \tau, \tau \in \hat{A}$ "; moreover $\operatorname{Ind}_{A}^{B} \tau=2 \rho$ and $\rho \mapsto \tau$ is a bijection $\hat{B} \xrightarrow{\sim} \hat{A}^{\prime \prime}$.

Let $x_{i}=\#\left\{\rho \in \hat{B}| | I_{\rho} \mid=i\right\},(i=1,2,4)$ and $y=\# \hat{B}$. Then $|\hat{B}|=x_{1}+x_{2}+x_{4}$, $|\hat{A}|=\frac{x_{1}}{p}+4 \frac{x_{2}+Y}{p}+16 \frac{x_{4}-Y}{p},(p=|B / A|)$. Hence if we assume also that $|\hat{A}|=\frac{x_{1}}{p}+4 \frac{x_{2}}{p}+16 \frac{x_{4}}{p}$, then $y=0$, so that the assumption of (a) is again satisfied.
10. Proposition. Let $G \subset G$ be a regular imbedding (Sec. 7). For any $\rho^{\prime} \in \hat{\mathrm{G}}^{\prime}{ }^{\mathrm{F}}$, the restriction $\rho^{\prime} \mid G^{F}$ is multiplicity free.

Proof. a) Assume first that $G$ is almost simple, simply connected and that $\operatorname{dim} Z_{G^{\prime}} \leqslant 1$ except that $\operatorname{dim} Z_{G^{\prime}}=2$ when $G=\operatorname{Spin}_{4 n}$ and char $\mathbb{F}_{\mathrm{q}^{\prime}} \neq 2$. If $\operatorname{dim} Z_{G^{\prime}} \leqslant 1$, or if $G=\operatorname{Spin}_{4 n}$ is non-split over $\mathbb{F}_{\mathrm{q}}$ (of odd characteristic) then $\mathrm{G}^{\mathrm{F}} / \mathrm{G}^{\mathrm{F}}$ is cyclic
and we may use $9(b)$. If $G=\operatorname{Spin} 4 n$ is split over $F_{q}$ of odd characteristic we use 9 (c) as follows. First note that in this case the set $\hat{\mathrm{G}}{ }^{\mathrm{F}}$ and the action of $\left(G^{\prime}{ }^{F} / G^{F}\right)^{-}$on it are determined explicity by Proposition 8.1. From this we can compute explicitly the numbers $\mathrm{x}_{1}, \mathrm{x}_{2}, \mathrm{x}_{4}$ in $9(\mathrm{c})$ for $\mathrm{A}=\mathrm{G}^{\mathrm{F}}, \mathrm{B}=\mathrm{G}^{\mathrm{F}}$. On the other hand we can count directly the number of conjugacy classes in the split $\operatorname{Spin}_{4 n}\left(F_{q}\right)$. This is the same as $|\hat{A}|$. We then compare $|\hat{A}|$ and $\frac{x_{1}}{p}+4 \frac{x_{2}}{p}+16 \frac{x_{4}}{p}$ ( $p=|B / A|$ ) and find that they are equal. We can apply 9 (c) and we see that the proposition holds.
(b) Assume next that $G$ is almost simple, simply connected but there is now no restriction on $\operatorname{dim} Z_{G}$, . We can find a regular imbedding $G \rightarrow \bar{G}$ which is like $G \rightarrow G^{\prime}$ in (a). Let $G^{\prime} \rightarrow G^{\prime \prime}, \bar{G} \rightarrow G^{\prime \prime}$ be as in 7.1. We have natural surjective maps $\hat{G}^{\prime}{ }^{F} \leftarrow \hat{G}^{\prime \prime F} \rightarrow \hat{\bar{G}}$ defined by restriction. Let $\rho^{\prime} \in \hat{G}^{\prime F}$ and let $\rho " \in \hat{G}^{\prime \prime} F$ be such that $\rho^{\prime \prime} \mid G^{\prime F}=\rho^{\prime}$. Let $\bar{\rho}=\rho^{\prime \prime} \mid \bar{G}^{F}$. By (a), $\bar{\rho} \mid G^{F}$ is multiplicity free ; the restrictions $\rho^{\prime}\left|G^{F}, \bar{\rho}\right| G^{F}$ coincide, hence $\rho^{\prime} \mid G^{F}$ is multiplicity free.
(c) Assume that $G$ is simply connected. Let $G \rightarrow \bar{G} \rightarrow G^{\prime \prime}, G^{\prime} \rightarrow G^{\prime \prime}$ be as in 8 (c). Arguing as in (b) we see that we can replace $G$ ' by $\bar{G}$ in which case we can use the case (b).
(d) Assume that $G$ is semisimple. Let $\widetilde{G} \rightarrow \widetilde{G}$ ' be as in 8 (d). Then $\stackrel{\downarrow}{\mathrm{G}} \rightarrow \stackrel{\downarrow}{\mathrm{G}}{ }^{\prime}$
$\tilde{\rho}^{\prime}=\rho^{\prime} \mid \widetilde{G}^{\prime}{ }^{F}$ is irreducible since $\tilde{\mathrm{G}}^{\prime}{ }^{\mathrm{F}} \rightarrow \mathrm{G}^{\prime}{ }^{\mathrm{F}}$ is surjective. By (c), $\tilde{\rho}{ }^{\prime} \mid \widetilde{G}^{F}$ is multiplicity free. But $\left(\rho^{\prime} \mid G^{F}\right)\left|\widetilde{G}^{F}=\tilde{\rho}^{\prime}\right| \widetilde{G}^{F}$. Hence $\rho^{\prime} \mid G^{F}$ is multiplicity free.
(e) We now consider the general case. Let $G$ " be the derived group of $G$. By (d), $\rho^{\prime} \mid G^{\prime \prime}$ is multiplicity free. But $\left(\rho^{\prime} \mid G^{F}\right)\left|G^{\prime \prime}=\rho^{\prime}\right| G^{\prime \prime}$ hence $\rho^{\prime} \mid G^{F}$ is multiplicity free. This completes the proof.
11. Proof of Proposition 5.1. Let $G \rightarrow G$ be a regular imbedding (Sec.7), and let $s^{\prime} \in G^{\prime *}$ be an element which maps to $s \in G^{\star F}$ under the corresponding homomorphism $G^{\prime \star} \rightarrow G^{\star}$. Let $H^{\prime}=Z_{G^{\prime}}^{\mathrm{A}}\left(\mathrm{s}^{\prime}\right)$.

The action of $G^{\mathrm{F}} / \mathrm{G}^{\mathrm{F}}$ on $\hat{\mathrm{G}}^{\mathrm{F}}$ (see Sec.9) factors through the action of
${ }_{G_{a d}}^{F} / \pi\left(G^{F}\right)$ in Sec.3. (We have a natural surjective nomomorphism $G^{\prime}{ }^{F} / G^{F} \rightarrow G_{a d}^{F} / \pi\left(G^{F}\right)$ ). Hence in the statement of 5.1 . we can replace "orbits of $\left(Z_{G} / Z_{G}^{O}\right)_{F}$ "by "orbits of $G^{\prime}{ }^{F} / G^{F}$ ". The map $\psi$ in the proposition is defined as the composition

$$
\begin{aligned}
& \left(\hat{G}^{\mathrm{F}}\right)_{\mathrm{S}} \\
& \downarrow \\
& \left(\mathcal{G}^{F}\right)_{S} \bmod \text { action of } G^{F} / G^{F} \\
& \downarrow \text {, see Sec. } 10 \text { and } 9 \text { (a) } \\
& \left.\cup_{k \in K} F^{(\hat{G}}{ }^{\prime}\right)_{S^{\prime} k} \bmod \text { action of } K \cong\left(G^{F}{ }^{F} / G^{F}\right)^{-} \\
& \downarrow \text {, see Sec. } 8 \\
& \left(\hat{G}^{\prime}{ }^{F}\right)_{S^{\prime}}, \bmod \text { action of } K_{S^{\prime}}{ }^{\mathrm{F}}=H^{\mathrm{F}} / \mathrm{H}^{\mathrm{oF}} \\
& \downarrow \quad \text {, see Sec. } 8.1 \\
& (\hat{\mathrm{H}}, \mathrm{OF})_{1} \mathrm{mod} \text { action of } \mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}} \\
& \downarrow \quad \text {, see Sec. } 8 \\
& \left(\hat{\mathrm{H}}^{\mathrm{OF}}\right)_{1} \bmod \text { action of } \mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}} \text {. }
\end{aligned}
$$

The properties of $\psi$ follow easily from 9(a) ; for the multiplicity formula we use that :

$$
\begin{aligned}
& R_{T}^{G}(s)=R_{T}^{G^{\prime}}\left(s^{\prime}\right) \mid G^{F} \quad\left(T^{\prime}=\text { inverse image of } T \subset G^{\prime \star} \rightarrow G^{\star}\right) \\
& i{ }^{\prime}{ }_{G_{G}}^{G}{ }^{\prime}{ }^{F}(\rho)=\sum_{\rho^{\prime} \in \theta^{\prime}} \quad \rho^{\prime} \quad+\text { representation of } G^{\prime}{ }^{\prime} \text { outside }\left(\hat{G}^{\prime}{ }^{F}\right)_{s^{\prime}},
\end{aligned}
$$

where $\left.\theta^{\prime} \subset\left(\hat{G}^{\prime}\right)^{F}\right)_{S}$, is the $H^{F} / H^{O F}$-orbit determined by $\rho$. $\theta^{\prime}$ corresponds to a

$$
\begin{aligned}
(\rho & \left.: R_{T}^{G}(s)\right){ }_{G^{F}}=\left(\rho: R_{T}^{G^{\prime}}\left(s^{\prime}\right) \mid G^{F}\right){ }_{G}^{F} \\
& =\left(i n d{ }_{G^{F}}{ }^{\prime}{ }^{F}(\rho): R_{T} G^{\prime}\left(s^{\prime}\right)\right){ }_{G^{\prime}}{ }^{F} \\
& =\left({ }_{\rho^{\prime} \in \theta^{\prime}} \rho^{\prime}: R_{T} G^{\prime}\left(s^{\prime}\right)\right){ }_{G^{\prime}}, F
\end{aligned}
$$

$$
\begin{aligned}
& =\varepsilon_{G}, \varepsilon_{H^{\prime}} \quad \sum_{\rho_{1}^{\prime} \in \Theta_{1}^{\prime}} \quad\left(\rho_{1}^{\prime}: R_{T^{\prime}}^{H^{\prime} \circ}(1)\right)_{H^{\prime}}, \circ F \\
& \text { by 6.1, 8.1, } \\
& =\varepsilon_{G} \varepsilon_{H} \sum_{\bar{\rho} \in \Theta}\left(\bar{\rho}: R_{T}^{H_{T}^{O}}(1)\right)_{H^{\circ}} .
\end{aligned}
$$

This completes the proof.
12. In the setup of $\operatorname{Sec} .4$, we say that an irreducible representation of $\mathrm{H}^{\mathrm{F}}$ is unipotent if its restriction to $\mathrm{H}^{\mathrm{OF}}$ is a sum of unipotent representations of $\mathrm{H}^{\mathrm{OF}}$. Let $\left(\hat{\mathrm{H}}^{\mathrm{F}}\right)_{1}$ be the set of unipotent representations of $\mathrm{H}^{\mathrm{F}}$. It is easy to see that 9 (a) (for $H^{\circ F} \subset H^{F}$ ) provides a surjective map

$$
\psi^{\prime}:\left(\hat{H}^{\mathrm{F}}\right)_{1} \rightarrow\left(\hat{\mathrm{H}}^{\mathrm{OF}}\right)_{1} \bmod \text { action of } \mathrm{H}^{\mathrm{F}} / \mathrm{H}^{\mathrm{OF}}
$$

with the following property : the fibres of $\psi^{\prime}$ and $\psi$ over the same point have the same cardinal. Hence there exists a bijection

$$
\psi^{\prime \prime}:\left(\hat{\mathrm{G}}^{\mathrm{F}}\right)_{\mathrm{s}} \xrightarrow{\sim}\left(\hat{\mathrm{H}}^{\mathrm{F}}\right)_{1}
$$

such that $\psi=\psi^{\prime} \circ \psi^{\prime \prime}$.
13. The parametrizations of $\hat{G}$ Fonsidered here and in $[4 \mid$ are to some extent non-canonical. It is likely that these will be canonical when they will be related to character sheaves. Note also that the crucial part of our proof (the multiplicity 1 statement in Sec. 10 for $\operatorname{Spin}_{4 n}\left(\mathbb{F}_{q}{ }^{\prime}\right)$ ) involves some very long and unpleasant computations of the number of conjugacy classes and unpleasant computations of the number of conjugacy classes and irreducible representations of $\operatorname{Spin}_{4 n}\left(\mathbb{F}_{q}\right)$. Although these computations give the desired results, they don't show why the result holds. One can give a somewhat more satisfactory proof, using character sheaves on $\operatorname{Spin}_{4 n}$.
14. The parametrization of $\hat{\mathrm{G}}^{\mathrm{F}}$ given in [5] is in terms of a dual group over $\mathbb{C}$ rather than over $\overline{\mathbb{F}}_{q}$; however that parametrization is equivalent to the one given here.
