## PROPAGATION OF ANALYTIC SINGULARITIES UP TO NON SMOOTH BOUNDARY

#### Pierre SCHAPIRA

#### 1.- Propagation for sheaves

We shall follow the notations of <code>[K-S 1]</code>. In particular if <code>X</code> is a real manifold, we denote by <code>D^b(X)</code> the derived category of the category of complexes of sheaves with bounded cohomology, and if <code>F & D^b(X)</code> we denote by <code>SS(F)</code> its microsupport. Recall that <code>SS(F)</code> is a closed conic involutive subset of <code>T\*X</code>. We shall also make use of the bifunctor <code>\muhom, from D^b(X)^0 \times D^b(X)</code> to <code>D^b(T\*X)</code>, a slight generalization of the functor of <code>Sato's microlocalization</code>.

Let h be a real C<sup>2</sup>-function defined on an open subset U of  $T^*X$ ,  $H_h$  its hamiltonian vectir field. If  $(x;\xi)$  is a system of homogeneous symplectic coordinates, with  $\omega_X = \sum_j \xi_j \, dx_j$ , then:

(1.1) 
$$H_{h} = \sum_{j} \left( \frac{\partial h}{\partial \xi_{j}} \frac{\partial}{\partial x_{j}} - \frac{\partial h}{\partial x_{j}} \frac{\partial}{\partial \xi_{j}} \right) .$$

If  $p \in U$  we denote by  $b_p^+$  the positive half integral curve of  $H_h$  issued at p. We define similarly  $b_p^-$  and  $b_p^- = b_p^- \cup b_p^+$ . We also set for \*=0,+,-:

(1.2) 
$$V_* = \{ p \in U ; h(p) \ge 0 \ (* = +) \ or$$
  $h(p) \le 0 \ (* = -) \ or \ h(p) = 0 \ (* = 0) \}.$ 

The following result is easily deduced from [K-S 1, Th. 5.2.1].

Theorem 1.1. Let F and G belong to  $D^b(X)$  with  $SS(G) \cap U \subset V_-, SS(F) \cap U \subset V_+. \text{ Let } j \in \mathbf{Z} \text{ and let}$  u be a section of  $H^j(\mu hom(G,F))$  on U. Then  $p \in supp(u) \text{ implies } b_p^+ \subset supp(u).$ 

(Remark that supp(u) is contained in  $V_0$ ).

#### 2.- Wave front sets at the boundary [S 1]

Let M be a real analytic manifold of dimension n , X a complexification of M ,  $\Omega$  an open subset of M . We introduce :

(2.1) 
$$C_{\Omega \mid X} = \mu hom(\mathbf{Z}_{\Omega}, \mathcal{O}_{X}) \otimes \underline{\omega}_{M/X}[n]$$

where  $\underline{\omega}_{\text{M/X}}$  is the relative orientation sheaf.

Let  $\pi$  denote the projection  $\texttt{T}^*X \longrightarrow \texttt{X}$  , and let  $\texttt{B}_M = \texttt{R}\Gamma_M(\mathfrak{S}_X') \otimes \underline{\omega}_{M/X} \ \big[ \texttt{n} \big] \ \text{denote the sheaf of Sato's hyperfunctions on } \texttt{M} \ .$  There is a natural isomorphism :

(2.2) 
$$\alpha : \Gamma_{\Omega}(B_{\mathbf{M}}) \xrightarrow{\sim} \pi_{*} H^{O}(C_{\Omega \mid X})$$
.

Hence a hyperfunction u on  $\Omega$  defines a section  $\alpha\left(u\right)$  of  $H^{O}\left(C_{\Omega\,\big|\,X}\right)$  all over  $T^{*}X$  . We set :

(2.3) 
$$SS_{\Omega}(u) = supp(\alpha(u))$$
.

Since  $H^O(C_{\Omega \mid X})$  is supported by the conormal boundle  $T_M^*X$ ,  $SS_{\Omega}(u)$  is a closed conic subset of  $T_M^*X$ . It coı̈ncides with the classical analytical wave front set above  $\Omega$ , but it may be strictly larger that its closure in  $T_M^*X$  (cf. [S 1]).

Now let P be a differential operator defined on X , and assume for simplicity that the principal symbol  $\sigma(P)$  never vanishes identically. Let  $\sigma_X^P$  denote the sheaf of holomorphic solutions of the equation Pf = 0 . Replacing  $\sigma_X$  by  $\sigma_X^P$  in the preceding discussion, we define :

(2.4) 
$$C_{\Omega \mid X}^{P} = \mu hom(\mathbf{Z}_{\Omega}, \Theta_{X}^{P}) \otimes \underline{\omega}_{M/X} [n]$$
.

Let  $B_M^P$  denote the sheaf of hyperfunction solutions of the equation Pu=0. There is a natural isomorphism:

(2.5) 
$$\alpha : \Gamma_{\Omega}(B_{M}^{P}) \xrightarrow{\sim} \pi_{*} H^{O}(C_{\Omega \mid X}^{P})$$
.

If u is a hyperfunction on  $\Omega$  solution of the equation Pu = 0 , we set :

(2.6) 
$$SS_{\Omega}^{P}(u) = supp(\alpha(u)).$$

Remark that

(2.7) 
$$SS_{\Omega}^{P}(u) \subset SS(\mathbf{Z}_{\Omega}) \cap char(P)$$

(where char(P) =  $\sigma(P)^{-1}(0))$  , but in general  $SS^P_\Omega(u)$  is no more contained in  $T^*_MX$  .

I don't know if  $SS_{\Omega}^{P}(u) \cap T_{M}^{*}X = SS_{\Omega}(u)$ , but this is true when  $M \setminus \Omega$  is convex (locally, up to analytic diffeomorphisms).

Of course the preceding discussion extends to solutions of general systems of differential equations (cf.  $\lceil S \ 1 \rceil$ ).

Now assume  $\partial\Omega=N$  is a real analytic hypersurface and let Y be a complexification of N in X . Assume P of order m, Y is non characteristic for P , and a normal vector field to N in M is given, so that the induced system  $(D_X/D_XP)_Y$  is isomorphic to  $D_Y^m$ ; (as usual,  $D_X$  denotes the ring of differential operators).

Let  $\rho$  and  $\overline{\omega}$  denote the natural maps associated to Y ---> X:

(2.8) 
$$T^*Y \leftarrow \xrightarrow{\rho} Y \times T^*X \xrightarrow{\overline{\omega}} T^*X .$$

Let  $u \in \Gamma(\Omega; B_M^P)$  be a hyperfunction on  $\Omega$  solution of Pu = 0, and let  $b(u) \in \Gamma(N; B_N^m)$  be its traces. Recall (cf.  $[S \ 1]$ ,  $[S \ 2]$ ):

Theorem 2.1. In the preceding situation, one has:  $SS_{N}(b(u)) = \rho \ \overline{\omega}^{-1} SS_{\Omega}^{P}(u) \ .$ 

In other words, the analytic wave front set of b(u) is exactly the projection of  $SS^P_\Omega(u)$ . Remark that if  $char(P) \cap SS(\mathbf{Z}_\Omega)$  is contained in  $T^*_M X$ ,  $SS^P_\Omega(u)$  may be replaced by  $SS_\Omega(u)$  in Theorem 2.1.

Remark moreover that b(u) does not make sense when  $\, \vartheta \Omega \,$  is not smooth, but  $\, SS_{\Omega} \, (u) \,$  always does.

# 3.- Transversal propagation for non smooth boundaries Let M be a real analytic manifold, X a complexification of M , $\Omega$ an open subset of M .

If  $\mathbf{x} \in \mathbf{M}$  , the cone  $N_{\mathbf{x}}(\Omega)$  is defined in <code>[K-S 1]</code> . Recall that N  $_{\mathbf{v}}(\Omega)$  is an open convex cone of T  $_{\mathbf{v}}M$  , and  $\theta \in N_{\mathbf{v}}(\Omega)$  ,  $\theta \neq 0$  implies that there exists a convex open cone  $\gamma$  (in a system of local coordinates around x) such that  $\theta$   $\epsilon$   $\gamma$  and  $\Omega + \gamma \subset \Omega$ .

We shall have to consider the real underlying structure of  $T^*X$ . Recall that if  $\omega_{X}^{}$  is the complex canonical 1-form on T\*X , this real symplectic structure in defined by  $\ 2\mbox{Re}\ \omega_{_{\mbox{\scriptsize $v$}}}$  .

If h is a real C2-function on T $^*$ X , we denote by  $\mathrm{H}_\mathrm{h}^{\mathrm{IR}}$  its real Hamiltonian vector field.

(z; ζ) is a system of homogeneous holomorphic symplectic coordinates on  $T^*X$ , such that  $\omega_X = \sum_{j} \zeta_j dz_j$ , and z = x + iy,  $\zeta = \xi + i\eta$  , then

$$(3.1) \qquad H_{\mathbf{h}}^{\mathbb{JR}} = \sum_{\mathbf{j}} \left( \frac{\partial \mathbf{h}}{\partial \xi_{\mathbf{j}}} \frac{\partial}{\partial \mathbf{x}_{\mathbf{j}}} - \frac{\partial \mathbf{h}}{\partial \mathbf{x}_{\mathbf{j}}} \frac{\partial}{\partial \xi_{\mathbf{j}}} + \frac{\partial \mathbf{h}}{\partial \mathbf{y}_{\mathbf{j}}} \frac{\partial}{\partial \eta_{\mathbf{j}}} - \frac{\partial \mathbf{h}}{\partial \eta_{\mathbf{j}}} \frac{\partial}{\partial \mathbf{y}_{\mathbf{j}}} \right) .$$

Now let P be a differential operator on X , u a hyperfunction on  $\Omega$  , solution of the equation Pu = 0 . Let  $p \in T_M^*X$  ,  $x_0 = \pi(p)$ .

#### Theorem 3.1. Assume:

a) Im 
$$\sigma(P) \Big|_{T_{\mathbf{M}}^* X} = 0$$

a) Im 
$$\sigma(P) \Big|_{T_{M}^{*}X} = 0$$
  
b)  $\pi(H_{Im \sigma(P)}^{lR}(p)) \in N_{X_{O}}(\Omega)$ .

Let  $b_p^+$  be the positive half integral curve of  $H_{\text{Im }\sigma}^{\text{IR}}(P)$  issued at p. Then  $p \in SS_{\Omega}(u)$  implies  $b_p^+ \subset SS_{\Omega}(u)$ .

#### Proof

We may assume X is open in  $\mathbb{C}^n$  and  $M=X\cap\mathbb{R}^n$ . Then there exists a convex open cone  $\gamma$  such that  $\Omega+\gamma\subset\Omega$  (in a neighborhood of  $x_0$ ) and  $\pi(H^{\mathbb{R}}_{\operatorname{Im}\sigma(P)}(p))$   $\varepsilon$   $\gamma$ . This last condition implies:

$$< d_{\xi}$$
 Im  $\sigma(P)(x,i\eta),\xi > \ge c|\xi|$ 

for some  $\,c\,>\,0$  , and all  $\,\xi\,\,\epsilon\,\,\gamma^{\,O}\,\,$  (  $\gamma^{\,O}\,\,$  is the polar set to  $\,\gamma$  ). Hence :

(3.2) Im 
$$\sigma(P)(x, \xi + i\eta) \leq 0$$

for  $(x,\,\xi+i\eta)$  in a neighborhood of p ,  $\xi\,\,\epsilon\,\,\gamma^{\mbox{\scriptsize oa}}$  , where  $\gamma^{\mbox{\scriptsize oa}}\,=\,-\gamma^{\mbox{\scriptsize o}}$  .

Since  $\Omega + \gamma \subset \Omega$  , we have (cf. [K-S 1]) :

$$SS(\mathbf{Z}_{\bigcirc}) \subset T_{M}^{*}X + \gamma^{Oa}$$
.

Thus:

(3.3) Im 
$$\sigma(P) \leq 0$$
 on  $SS(\mathbf{Z}_{\Omega})$ 

in a neighborhood of p .

Now let  $u \in \Gamma(\Omega; B_M)$  be a solution of the equation Pu = 0. Then u defines a section  $\alpha(u) \in \Gamma(T^*X; H^n(\mu hom(\mathbf{Z}_\Omega, \boldsymbol{\theta}_X^P))$  and  $p \in SS_\Omega(u)$  implies  $p \in SS_\Omega^P(u)$ , that is,  $p \in supp(\alpha(u))$ . Since  $SS(\boldsymbol{\theta}_X^P) = char(P) \subset \{Im \ \sigma(P) = 0\}$ , we may apply Theorem 1.1 and we obtain:

$$b_p^+ \subset SS_{\Omega}^P(u)$$
.

But  $b_p^+ \setminus \{p\}$  is contained in  $\pi^{-1}(\Omega)$  and  $SS_\Omega^P(u) = SS_\Omega(u) = SS_M(u) \text{ above } \Omega \text{ . Thus } b_p^+ \subset SS_\Omega(u) \text{ ,}$  which is the desired result.

#### 4.- Diffraction

We keep the notations of §3, but we assume :

(4.1) 
$$\Omega = \{x \in M ; x_1 > 0\}$$

(4.2) 
$$\sigma(P) = \zeta_1^2 - g(z, \zeta')$$

where  $z = (z_1, z')$ ,  $\zeta = (\zeta_1, \zeta')$ .

Moreover we assume :

(4.3) a) 
$$\frac{\partial}{\partial x_1} g < 0$$
 at p or b)  $\frac{\partial}{\partial x_1} g \equiv 0$ .

Theorem 4.1. Under these hypotheses, if  $p \in SS_{\Omega}(u)$  then  $b_p^+$  or  $b_p^-$  is contained in  $SS_{\Omega}(u)$ , in a neighborhood of p.

The idea of the proof is the following.

If  $\zeta_1 \neq 0$  at p, the result is a particular case of Theorem 3.1 . Otherwise define for \*=0,1,-:

$$\Omega_* = \{z \in X ; x_1 > 0, y' = 0, y_1 \in \mathbb{R} (* = 0) \}$$
or  $y_1 \ge 0 (* = +)$  or  $y_1 \le 0 (+ = -) \}$ 

Thus Im  $\sigma(P)$  is negative (resp. positive) on  $SS(\mathbf{Z}_{\Omega+})$  (resp.  $SS(\mathbf{Z}_{\Omega-})$ ) in a neighborhood of p. Then one can apply Theorem 1.1 to  $\mu hom(\mathbf{Z}_{\Omega*}, O_{\mathbf{X}}^P)$ , \* = + or - , and one obtain that if  $\mathbf{u} \mid_{\mathbf{b}_{\mathbf{p}}}$  has compact support, then  $\mathbf{u} \in \mathbf{H}^{n-1}(\mu hom(\mathbf{Z}_{\Omega_{\mathbf{o}}}, O_{\mathbf{X}}^P))$ , and it is not difficult to conclude using the holomorphic parameter  $\mathbf{z}_1$  (cf.  $[S\ 2]$ ).

Remark that Theorem 4.1 has been first obtained by Kataoka [Ka] (under hypothesis (4.3) a)) then refined by G. Lebeau [Le].

An application: Let  $(x_1,\ldots,x_n)$  be the coordinates on  $\mathbb{R}^n$ , and let  $\Omega_1$  and  $\Omega_2$  be two open half spaces. Set  $\Omega = \Omega_1 \cup \Omega_2$  and let  $\Omega$ 0 be a hyperfunction on  $\Omega$ 0. One can easily prove:

(4.4) 
$$SS_{\Omega}(u) = SS_{\Omega_1}(u) \cup SS_{\Omega_2}(u) .$$

Now assume  $\Omega_i = lR \times \Omega_i^t$ , (i = 1,2) and u satisfies the wave equation Pu = 0 , where P =  $D_1^2 - \sum_{j=2}^n D_j^2$ .

Applying Theorem 4.1 we get that  $p \in SS_{\Omega}(u) \Longrightarrow b_p^+$  or  $b_p^-$  is contained in  $SS_{\Omega}(u)$ , where  $b_p^+$  and  $b_p^-$  are the half bicharacteristic curves of Im  $\sigma(P)$ .

 $\begin{array}{l} \underline{\text{Problem}} \text{ : to extend this result to the case where} \\ \mathbb{R}^n \backslash \Omega = \mathbb{R}^\times A \text{ , and } A \text{ is any convex closed subset of } \mathbb{R}^{n-1} \text{ .} \\ \\ \text{Remark that if } \mathbb{R}^n \backslash \Omega = \mathbb{R}^\times A \text{ , where } A \text{ is polyedral, and} \\ \\ \text{if } p \in SS_{\Omega}(u) \text{ , } b_p^+ \backslash \{p\} \subseteq \pi^{-1}(\Omega) \text{ then } b_p^+ \subseteq SS_{\Omega}(u) \text{ , in view of Theorem 3.1.} \\ \end{array}$
